## Introduction

This reference manual targets application developers. It provides complete information on how to use the STM32L47xxx/STM32L48xxx/STM32L49xxx/STM32L4Axxx microcontroller memory and peripherals.

The STM32L47xxx/STM32L48xxx/STM32L49xxx/STM32L4Axxx is a family of microcontrollers with different memory sizes, packages and peripherals.

For ordering information, mechanical and electrical device characteristics please refer to the corresponding datasheets.

For information on the Arm® Cortex®-M4 core, please refer to the Cortex®-M4 Technical Reference Manual.

The STM32L47x/L48x/L49x/L4Ax microprocessors include ST state-of-the-art patented technology.

## 6 Reset and clock control (RCC) . . . . . 203

|        |                                                                       |     |
|--------|-----------------------------------------------------------------------|-----|
| 6.1    | Reset .....                                                           | 203 |
| 6.1.1  | Power reset .....                                                     | 203 |
| 6.1.2  | System reset .....                                                    | 203 |
| 6.1.3  | Backup domain reset .....                                             | 204 |
| 6.2    | Clocks .....                                                          | 205 |
| 6.2.1  | HSE clock .....                                                       | 211 |
| 6.2.2  | HSI16 clock .....                                                     | 212 |
| 6.2.3  | MSI clock .....                                                       | 213 |
| 6.2.4  | HSI48 clock (only valid for STM32L49x/L4Ax devices) .....             | 213 |
| 6.2.5  | PLL .....                                                             | 214 |
| 6.2.6  | LSE clock .....                                                       | 215 |
| 6.2.7  | LSI clock .....                                                       | 215 |
| 6.2.8  | System clock (SYSCLK) selection .....                                 | 215 |
| 6.2.9  | Clock source frequency versus voltage scaling .....                   | 216 |
| 6.2.10 | Clock security system (CSS) .....                                     | 216 |
| 6.2.11 | Clock security system on LSE .....                                    | 217 |
| 6.2.12 | USB Clock .....                                                       | 217 |
| 6.2.13 | ADC clock .....                                                       | 217 |
| 6.2.14 | RTC clock .....                                                       | 217 |
| 6.2.15 | Timer clock .....                                                     | 218 |
| 6.2.16 | Watchdog clock .....                                                  | 218 |
| 6.2.17 | Clock-out capability .....                                            | 218 |
| 6.2.18 | Internal/external clock measurement with TIM15/TIM16/TIM17 .....      | 219 |
| 6.2.19 | Peripheral clock enable register<br>(RCC_AHBxENR, RCC_APBxENRy) ..... | 221 |
| 6.3    | Low-power modes .....                                                 | 222 |
| 6.4    | RCC registers .....                                                   | 223 |
| 6.4.1  | Clock control register (RCC_CR) .....                                 | 223 |
| 6.4.2  | Internal clock sources calibration register (RCC_ICSCR) .....         | 226 |
| 6.4.3  | Clock configuration register (RCC_CFGR) .....                         | 227 |
| 6.4.4  | PLL configuration register (RCC_PLLCFGR) .....                        | 229 |
| 6.4.5  | PLLSAI1 configuration register (RCC_PLLSAI1CFGR) .....                | 232 |
| 6.4.6  | PLLSAI2 configuration register (RCC_PLLSAI2CFGR) .....                | 235 |
| 6.4.7  | Clock interrupt enable register (RCC_CIER) .....                      | 236 |
| 6.4.8  | Clock interrupt flag register (RCC_CIFR) .....                        | 238 |
| 6.4.9  | Clock interrupt clear register (RCC_CICR) .....                       | 239 |
| 6.4.10 | AHB1 peripheral reset register (RCC_AHB1RSTR) .....                   | 241 |

|          |                                                                                                |            |
|----------|------------------------------------------------------------------------------------------------|------------|
| 6.4.11   | AHB2 peripheral reset register (RCC_AHB2RSTR) . . . . .                                        | 242        |
| 6.4.12   | AHB3 peripheral reset register (RCC_AHB3RSTR) . . . . .                                        | 244        |
| 6.4.13   | APB1 peripheral reset register 1 (RCC_APB1RSTR1) . . . . .                                     | 244        |
| 6.4.14   | APB1 peripheral reset register 2 (RCC_APB1RSTR2) . . . . .                                     | 247        |
| 6.4.15   | APB2 peripheral reset register (RCC_APB2RSTR) . . . . .                                        | 248        |
| 6.4.16   | AHB1 peripheral clock enable register (RCC_AHB1ENR) . . . . .                                  | 249        |
| 6.4.17   | AHB2 peripheral clock enable register (RCC_AHB2ENR) . . . . .                                  | 251        |
| 6.4.18   | AHB3 peripheral clock enable register (RCC_AHB3ENR) . . . . .                                  | 252        |
| 6.4.19   | APB1 peripheral clock enable register 1 (RCC_APB1ENR1) . . . . .                               | 253        |
| 6.4.20   | APB1 peripheral clock enable register 2 (RCC_APB1ENR2) . . . . .                               | 256        |
| 6.4.21   | APB2 peripheral clock enable register (RCC_APB2ENR) . . . . .                                  | 258        |
| 6.4.22   | AHB1 peripheral clocks enable in Sleep and Stop modes register<br>(RCC_AHB1SMENR) . . . . .    | 259        |
| 6.4.23   | AHB2 peripheral clocks enable in Sleep and Stop modes register<br>(RCC_AHB2SMENR) . . . . .    | 261        |
| 6.4.24   | AHB3 peripheral clocks enable in Sleep and Stop modes register<br>(RCC_AHB3SMENR) . . . . .    | 263        |
| 6.4.25   | APB1 peripheral clocks enable in Sleep and Stop modes register 1<br>(RCC_APB1SMENR1) . . . . . | 263        |
| 6.4.26   | APB1 peripheral clocks enable in Sleep and Stop modes register 2<br>(RCC_APB1SMENR2) . . . . . | 266        |

## 48      **Debug support (DBG) .....**      **1813**

|         |                                                                      |      |
|---------|----------------------------------------------------------------------|------|
| 48.1    | Overview .....                                                       | 1813 |
| 48.2    | Reference Arm® documentation .....                                   | 1814 |
| 48.3    | SWJ debug port (serial wire and JTAG) .....                          | 1814 |
| 48.3.1  | Mechanism to select the JTAG-DP or the SW-DP .....                   | 1815 |
| 48.4    | Pinout and debug port pins .....                                     | 1815 |
| 48.4.1  | SWJ debug port pins .....                                            | 1816 |
| 48.4.2  | Flexible SWJ-DP pin assignment .....                                 | 1816 |
| 48.4.3  | Internal pull-up and pull-down on JTAG pins .....                    | 1816 |
| 48.4.4  | Using serial wire and releasing the unused debug pins as GPIOs ..    | 1818 |
| 48.5    | STM32L47x/L48x/L49x/L4Ax JTAG TAP connection .....                   | 1818 |
| 48.6    | ID codes and locking mechanism .....                                 | 1819 |
| 48.6.1  | MCU device ID code .....                                             | 1820 |
| 48.6.2  | Boundary scan TAP .....                                              | 1820 |
| 48.6.3  | Cortex®-M4 TAP .....                                                 | 1820 |
| 48.6.4  | Cortex®-M4 JEDEC-106 ID code .....                                   | 1821 |
| 48.7    | JTAG debug port .....                                                | 1821 |
| 48.8    | SW debug port .....                                                  | 1823 |
| 48.8.1  | SW protocol introduction .....                                       | 1823 |
| 48.8.2  | SW protocol sequence .....                                           | 1823 |
| 48.8.3  | SW-DP state machine (reset, idle states, ID code) .....              | 1824 |
| 48.8.4  | DP and AP read/write accesses .....                                  | 1824 |
| 48.8.5  | SW-DP registers .....                                                | 1825 |
| 48.8.6  | SW-AP registers .....                                                | 1826 |
| 48.9    | AHB-AP (AHB access port) - valid for both JTAG-DP<br>and SW-DP ..... | 1826 |
| 48.10   | Core debug .....                                                     | 1827 |
| 48.11   | Capability of the debugger host to connect under system reset .....  | 1827 |
| 48.12   | FPB (Flash patch breakpoint) .....                                   | 1828 |
| 48.13   | DWT (data watchpoint trigger) .....                                  | 1828 |
| 48.14   | ITM (instrumentation trace macrocell) .....                          | 1829 |
| 48.14.1 | General description .....                                            | 1829 |
| 48.14.2 | Time stamp packets, synchronization and overflow packets .....       | 1829 |
| 48.15   | ETM (Embedded trace macrocell) .....                                 | 1831 |
| 48.15.1 | General description .....                                            | 1831 |
| 48.15.2 | Signal protocol, packet types .....                                  | 1831 |
| 48.15.3 | Main ETM registers .....                                             | 1831 |

|           |                                                                           |             |
|-----------|---------------------------------------------------------------------------|-------------|
| 48.15.4   | Configuration example .....                                               | 1832        |
| 48.16     | MCU debug component (DBGMCU) .....                                        | 1832        |
| 48.16.1   | Debug support for low-power modes .....                                   | 1832        |
| 48.16.2   | Debug support for timers, RTC, watchdog, bxCAN and I <sup>2</sup> C ..... | 1833        |
| 48.16.3   | Debug MCU configuration register (DBGMCU_CR) .....                        | 1833        |
| 48.16.4   | Debug MCU APB1 freeze register1(DBGMCU_APB1FZR1) .....                    | 1834        |
| 48.16.5   | Debug MCU APB1 freeze register 2 (DBGMCU_APB1FZR2) .....                  | 1836        |
| 48.16.6   | Debug MCU APB2 freeze register (DBGMCU_APB2FZR) .....                     | 1836        |
| 48.17     | TPIU (trace port interface unit) .....                                    | 1838        |
| 48.17.1   | Introduction .....                                                        | 1838        |
| 48.17.2   | TRACE pin assignment .....                                                | 1838        |
| 48.17.3   | TPUI formatter .....                                                      | 1840        |
| 48.17.4   | TPUI frame synchronization packets .....                                  | 1841        |
| 48.17.5   | Transmission of the synchronization frame packet .....                    | 1841        |
| 48.17.6   | Synchronous mode .....                                                    | 1841        |
| 48.17.7   | Asynchronous mode .....                                                   | 1842        |
| 48.17.8   | TRACECLKIN connection inside the<br>STM32L47x/L48x/L49x/L4Ax .....        | 1842        |
| 48.17.9   | TPIU registers .....                                                      | 1843        |
| 48.17.10  | Example of configuration .....                                            | 1844        |
| 48.18     | DBG register map .....                                                    | 1845        |
| <b>49</b> | <b>Device electronic signature .....</b>                                  | <b>1846</b> |
| 49.1      | Unique device ID register (96 bits) .....                                 | 1846        |
| 49.2      | Flash size data register .....                                            | 1847        |
| 49.3      | Package data register .....                                               | 1848        |

# 1 Documentation conventions

## 1.1 General information

The STM32L47x/L48x/L49x/L4Ax devices have an Arm<sup>®(a)</sup> Cortex<sup>®</sup>-M4 core.

## 1.2 List of abbreviations for registers

The following abbreviations<sup>(b)</sup> are used in register descriptions:

|                                 |                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| read/write (rw)                 | Software can read and write to this bit.                                                                                       |
| read-only (r)                   | Software can only read this bit.                                                                                               |
| write-only (w)                  | Software can only write to this bit. Reading this bit returns the reset value.                                                 |
| read/clear write0 (rc_w0)       | Software can read as well as clear this bit by writing 0. Writing 1 has no effect on the bit value.                            |
| read/clear write1 (rc_w1)       | Software can read as well as clear this bit by writing 1. Writing 0 has no effect on the bit value.                            |
| read/clear write (rc_w)         | Software can read as well as clear this bit by writing to the register. The value written to this bit is not important.        |
| read/clear by read (rc_r)       | Software can read this bit. Reading this bit automatically clears it to 0. Writing this bit has no effect on the bit value.    |
| read/set by read (rs_r)         | Software can read this bit. Reading this bit automatically sets it to 1. Writing this bit has no effect on the bit value.      |
| read/set (rs)                   | Software can read as well as set this bit. Writing 0 has no effect on the bit value.                                           |
| read/write once (rwo)           | Software can only write once to this bit and can also read it at any time. Only a reset can return the bit to its reset value. |
| toggle (t)                      | The software can toggle this bit by writing 1. Writing 0 has no effect.                                                        |
| read-only write trigger (rt_w1) | Software can read this bit. Writing 1 triggers an event but has no effect on the bit value.                                    |
| Reserved (Res.)                 | Reserved bit, must be kept at reset value.                                                                                     |

a. Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

b. This is an exhaustive list of all abbreviations applicable to STMicroelectronics microcontrollers, some of them may not be used in the current document.

## 1.3 Glossary

This section gives a brief definition of acronyms and abbreviations used in this document:

- **Word:** data of 32-bit length.
- **Half-word:** data of 16-bit length.
- **Byte:** data of 8-bit length.
- **IAP (in-application programming):** IAP is the ability to re-program the flash memory of a microcontroller while the user program is running.
- **ICP (in-circuit programming):** ICP is the ability to program the flash memory of a microcontroller using the JTAG protocol, the SWD protocol or the bootloader while the device is mounted on the user application board.
- **Option bytes:** product configuration bits stored in the flash memory.
- **OBL:** option byte loader.
- **AHB:** advanced high-performance bus.
- **APB:** advanced peripheral bus.

## 1.4 Availability of peripherals

For availability of peripherals and their number across all products, refer to the particular device datasheet.

## 2 System and memory overview

### 2.1 System architecture

The main system consists of 32-bit multilayer AHB bus matrix that interconnects:

- Up to six masters:
  - Cortex<sup>®</sup>-M4 with FPU core I-bus
  - Cortex<sup>®</sup>-M4 with FPU core D-bus
  - Cortex<sup>®</sup>-M4 with FPU core S-bus
  - DMA1
  - DMA2
  - DMA2D (only for STM32L49x/L4Ax devices)
- Up to eight slaves:
  - Internal Flash memory on the ICode bus
  - Internal Flash memory on DCode bus
  - Internal SRAM1 (96 KB for STM32L47x/L48x devices, 256 KB for STM32L49x/L4Ax devices)
  - Internal SRAM2 (32 KB for STM32L47x/L48x devices, 64 KB for STM32L49x/L4Ax devices)
  - AHB1 peripherals including AHB to APB bridges and APB peripherals (connected to APB1 and APB2)
  - AHB2 peripherals
  - Flexible Memory Controller (FMC)<sup>(a)</sup>
  - Quad SPI memory interface (QUADSPI)<sup>(a)</sup>

The bus matrix provides access from a master to a slave, enabling concurrent access and efficient operation even when several high-speed peripherals work simultaneously. This architecture is shown in [Figure 1](#) for STM32L47x/L48x devices, and shown in [Figure 2](#) for STM32L49x/L4Ax devices:

---

a. On STM32L47x/L48x devices, FMC and QUADSPI slaves are merged into same port.

Figure 1. System architecture for STM32L47x/L48x devices

Figure 2. System architecture for STM32L49x/L4Ax

### 2.1.1 S0: I-bus

This bus connects the instruction bus of the Cortex®-M4 core to the BusMatrix. This bus is used by the core to fetch instructions. The targets of this bus are the internal Flash memory, SRAM1, SRAM2 and external memories through QUADSPI or the FMC.

### 2.1.2 S1: D-bus

This bus connects the data bus of the Cortex®-M4 core to the BusMatrix. This bus is used by the core for literal load and debug access. The targets of this bus are the internal Flash memory, SRAM1, SRAM2 and external memories through QUADSPI or the FMC.

### 2.1.3 S2: S-bus

This bus connects the system bus of the Cortex®-M4 core to the BusMatrix. This bus is used by the core to access data located in a peripheral or SRAM area. The targets of this

bus are the SRAM1, the AHB1 peripherals including the APB1 and APB2 peripherals, the AHB2 peripherals and the external memories through the QUADSPI or the FMC.

On STM32L49x/L4Ax devices, the SRAM2 is also accessible on this bus to allow continuous mapping with SRAM1.

#### 2.1.4 S3, S4: DMA-bus

This bus connects the AHB master interface of the DMA to the BusMatrix. The targets of this bus are the SRAM1 and SRAM2, the AHB1 peripherals including the APB1 and APB2 peripherals, the AHB2 peripherals and the external memories through the QUADSPI or the FMC.

#### 2.1.5 S5: DMA2D-bus<sup>(a)</sup>

This bus connects the AHB master interface of the DMA2D to the BusMatrix. The targets of this bus are the SRAM1 and SRAM2 and external memories through the QUADSPI or the FMC.

#### 2.1.6 BusMatrix

The BusMatrix manages the access arbitration between masters. The arbitration uses a Round Robin algorithm. The BusMatrix is composed of up to six masters (CPU AHB, system bus, DCode bus, ICode bus, DMA1, DMA2 and DMA2D bus) and up to eight slaves (FLASH, SRAM1, SRAM2, AHB1 (including APB1 and APB2), AHB2, QUADSPI and FMC).

##### AHB/APB bridges

The two AHB/APB bridges provide full synchronous connections between the AHB and the two APB buses, allowing flexible selection of the peripheral frequency.

Refer to [Section 2.2: Memory organization on page 75](#) for the address mapping of the peripherals connected to this bridge.

After each device reset, all peripheral clocks are disabled (except for the SRAM1/2 and Flash memory interface). Before using a peripheral you have to enable its clock in the RCC\_AHBxENR and the RCC\_APBxENR registers.

**Note:** *When a 16- or 8-bit access is performed on an APB register, the access is transformed into a 32-bit access: the bridge duplicates the 16- or 8-bit data to feed the 32-bit vector.*

---

a. it is present on L496/L4A6 only

## **2.2 Memory organization**

### **2.2.1 Introduction**

Program memory, data memory, registers and I/O ports are organized within the same linear 4-Gbyte address space.

The bytes are coded in memory in Little Endian format. The lowest numbered byte in a word is considered the word's least significant byte and the highest numbered byte the most significant.

The addressable memory space is divided into eight main blocks, of 512 Mbytes each.

## 2.2.2 Memory map and register boundary addresses

Figure 3. Memory map for STM32L47x/L48x devices

Figure 4. Memory map for STM32L49x/L4Ax devices

It is forbidden to access QUADSPI Flash bank area before having properly configured and enabled the QUADSPI peripheral.

All the memory map areas that are not allocated to on-chip memories and peripherals are considered “Reserved”. For the detailed mapping of available memory and register areas, refer to the following table.

The following table gives the boundary addresses of the peripherals available in the devices.

**Table 1. STM32L47x/L48x devices memory map and peripheral register boundary addresses<sup>(1)</sup>**

| Bus  | Boundary address          | Size (bytes) | Peripheral            | Peripheral register map                               |
|------|---------------------------|--------------|-----------------------|-------------------------------------------------------|

1. The gray color is used for reserved boundary addresses.

2. Available on STM32L4Ax only.

## 2.3 Bit banding

The Cortex<sup>®</sup>-M4 memory map includes two bit-band regions. These regions map each word in an alias region of memory to a bit in a bit-band region of memory. Writing to a word in the alias region has the same effect as a read-modify-write operation on the targeted bit in the bit-band region.

In the STM32L4x6 devices both the peripheral registers and the SRAM1 are mapped to a bit-band region, so that single bit-band write and read operations are allowed. The operations are only available for Cortex<sup>®</sup>-M4 accesses, and not from other bus masters (e.g. DMA).

A mapping formula shows how to reference each word in the alias region to a corresponding bit in the bit-band region. The mapping formula is:

$$\text{bit\_word\_addr} = \text{bit\_band\_base} + (\text{byte\_offset} \times 32) + (\text{bit\_number} \times 4)$$

where:

- *bit\_word\_addr* is the address of the word in the alias memory region that maps to the targeted bit
- *bit\_band\_base* is the starting address of the alias region
- *byte\_offset* is the number of the byte in the bit-band region that contains the targeted bit
- *bit\_number* is the bit position (0-7) of the targeted bit

### Example

The following example shows how to map bit 2 of the byte located at SRAM1 address 0x20000300 to the alias region:

$$0x22006008 = 0x22000000 + (0x300 \times 32) + (2 \times 4)$$

Writing to address 0x22006008 has the same effect as a read-modify-write operation on bit 2 of the byte at SRAM1 address 0x20000300.

Reading address 0x22006008 returns the value (0x01 or 0x00) of bit 2 of the byte at SRAM1 address 0x20000300 (0x01: bit set; 0x00: bit reset).

For more information on bit-banding, refer to the *Cortex®-M4 programming manual* (see [Related documents on page 1](#)).

## 2.4 Embedded SRAM

The STM32L47x/L48x/L49x/L4Ax devices feature up to 320 Kbytes SRAM:

- 96 Kbytes SRAM1 and 32 Kbyte SRAM2 on STM32L47x/L48x.
- 256 Kbyte SRAM1 and 64 Kbyte SRAM2 on STM32L49x/L4Ax devices.

These SRAM can be accessed as bytes, half-words (16 bits) or full words (32 bits). These memories can be addressed at maximum system clock frequency without wait state and thus by both CPU and DMA.

The CPU can access the SRAM1 through the system bus or through the ICode/DCode buses when boot from SRAM1 is selected or when physical remap is selected ([Section 9.2.1: SYSCFG memory remap register \(SYSCFG\\_MEMRMP\)](#) in the SYSCFG controller). To get the maximum performance on SRAM1 execution, physical remap should be selected (boot or software selection).

Execution can be performed from SRAM2 with maximum performance without any remap thanks to access through ICode bus.

On STM32L49x/L4Ax devices, the SRAM2 is aliased at address 0x2004 0000, offering a continuous address space with the SRAM1.

### 2.4.1 SRAM2 parity check

The user can enable the SRAM2 parity check using the option bit SRAM2\_PE in the user option byte (refer to [Section 3.4.1: Option bytes description](#)).

The data bus width is 36 bits because 4 bits are available for parity check (1 bit per byte) in order to increase memory robustness, as required for instance by Class B or SIL norms.

The parity bits are computed and stored when writing into the SRAM2. Then, they are automatically checked when reading. If one bit fails, an NMI is generated. The same error can also be linked to the BRK\_IN Break input of TIM1/TIM8/TIM15/TIM16/TIM17, with the SPL control bit in the [SYSCFG configuration register 2 \(SYSCFG\\_CFGR2\)](#). The SRAM2 Parity Error flag (SPF) is available in the [SYSCFG configuration register 2 \(SYSCFG\\_CFGR2\)](#).

**Note:** *When enabling the RAM parity check, it is advised to initialize by software the whole RAM memory at the beginning of the code, to avoid getting parity errors when reading non-initialized locations.*

## 2.4.2 SRAM2 Write protection

The SRAM2 can be write protected with a page granularity of 1 Kbyte.

**Table 3. SRAM2 organization**

The write protection can be enabled in [SYSCFG SRAM2 write protection register \(SYSCFG\\_SWPR\)](#) in the SYSCFG block. This is a register with write '1' once mechanism, which means by writing '1' on a bit it will setup the write protection for that page of SRAM and it can be removed/cleared by a system reset only.

### 2.4.3 SRAM2 Read protection

The SRAM2 is protected with the Read protection (RDP). Refer to [Section 3.5.1: Read protection \(RDP\)](#) for more details.

### 2.4.4 SRAM2 Erase

The SRAM2 can be erased with a system reset using the option bit SRAM2\_RST in the user option byte (refer to [Section 3.4.1: Option bytes description](#)).

The SRAM2 erase can also be requested by software by setting the bit SRAM2ER in the [SYSCFG SRAM2 control and status register \(SYSCFG\\_SCSR\)](#).

## 2.5 Flash memory overview

The Flash memory is composed of two distinct physical areas:

- The main Flash memory block. It contains the application program and user data if necessary.
- The information block. It is composed of three parts:
  - Option bytes for hardware and memory protection user configuration.
  - System memory that contains the ST proprietary code.
  - OTP (one-time programmable) area

The Flash interface implements instruction access and data access based on the AHB protocol. It also implements the logic necessary to carry out the Flash memory operations (program/erase) controlled through the Flash registers. Refer to [Section 3: Embedded Flash memory \(FLASH\)](#) for more details.

## 2.6 Boot configuration

### 2.6.1 Boot configuration for STM32L47x/L48x devices

In the STM32L47x/L48x devices, three different boot modes can be selected through the BOOT0 pin and nBOOT1 bit in the User option byte, as shown in the following table.

**Table 4. Boot modes**

| Boot mode selection  |       | Boot mode         | Aliasing                                   |
|----------------------|-------|-------------------|--------------------------------------------|
| BOOT1 <sup>(1)</sup> | BOOT0 |                   |                                            |
| x                    | 0     | Main Flash memory | Main Flash memory is selected as boot area |
| 0                    | 1     | System memory     | System memory is selected as boot area     |
| 1                    | 1     | Embedded SRAM1    | Embedded SRAM1 is selected as boot area    |

1. The BOOT1 value is the opposite of the nBOOT1 Option Bit.

The values on both BOOT0 pin and nBOOT1 bit are latched after a reset. It is up to the user to set nBOOT1 and BOOT0 to select the required boot mode.

The BOOT0 pin and nBOOT1 bit are also re-sampled when exiting from Standby mode. Consequently they must be kept in the required Boot mode configuration in Standby mode. After this startup delay has elapsed, the CPU fetches the top-of-stack value from address 0x0000 0000, then starts code execution from the boot memory at 0x0000 0004.

Depending on the selected boot mode, main Flash memory, system memory or SRAM1 is accessible as follows:

- Boot from main Flash memory: the main Flash memory is aliased in the boot memory space (0x0000 0000), but still accessible from its original memory space (0x0800 0000). In other words, the Flash memory contents can be accessed starting from address 0x0000 0000 or 0x0800 0000.
- Boot from system memory: the system memory is aliased in the boot memory space (0x0000 0000), but still accessible from its original memory space (0x1FFF 0000).
- Boot from the embedded SRAM1: the SRAM1 is aliased in the boot memory space (0x0000 0000), but it is still accessible from its original memory space (0x2000 0000).

**Note:** *When the device boots from SRAM, in the application initialization code, you have to relocate the vector table in SRAM using the NVIC exception table and the offset register.*

When booting from the main Flash memory, the application software can either boot from bank 1 or from bank 2. By default, boot from bank 1 is selected.

To select boot from Flash memory bank 2, set the BFB2 bit in the user option bytes. When this bit is set and the boot pins are in the “boot from main Flash memory” configuration, the device boots from system memory, and the boot loader jumps to execute the user application programmed in Flash memory bank 2. The system memory remains aliased to the boot memory space (0x0000 0000). For further details, please refer to AN2606.

**Note:** *When booting from bank 2, the boot loader will swap the Flash memory banks. Consequently, in the application initialization code, you have to relocate the vector table to bank 2 swapped base address (0x0800 0000) using the NVIC exception table and offset register.*

## Physical remap

Once the boot pins are selected, the application software can modify the memory accessible in the code area (in this way the code can be executed through the ICode bus in place of the System bus). This modification is performed by programming the [SYSCFG memory remap register \(SYSCFG\\_MEMRMP\)](#) in the SYSCFG controller.

The following memories can thus be remapped:

- Main Flash memory
- System memory
- Embedded SRAM1 (96 KB)
- FSMC bank 1 (NOR/PSRAM 1 and 2)
- Quad-SPI memory

**Table 5. Memory mapping versus boot mode/physical remap**

| Addresses                            | Boot/remap in main Flash memory | Boot/remap in embedded SRAM 1   | Boot/remap in system memory     | Remap in FSMC                            | Remap in QUADSPI                |
|--------------------------------------|---------------------------------|---------------------------------|---------------------------------|------------------------------------------|---------------------------------|
| 0x2000 0000 - 0x2001 7FFF            | SRAM1                           | SRAM1                           | SRAM1                           | SRAM1                                    | SRAM1                           |
| 0x1FFF 0000 - 0x1FFF FFFF            | System memory/OTP/Options bytes | System memory/OTP/Options bytes | System memory/OTP/Options bytes | System memory/OTP/Options bytes          | System memory/OTP/Options bytes |
| 0x1000 8000 - 0x1FFE FFFF            | Reserved                        | Reserved                        | Reserved                        | Reserved                                 | Reserved                        |
| 0x1000 0000 - 0x1000 7FFF            | SRAM2                           | SRAM2                           | SRAM2                           | SRAM2                                    | SRAM2                           |
| 0x0810 0000 - 0x0FFF FFFF            | Reserved                        | Reserved                        | Reserved                        | Reserved                                 | Reserved                        |
| 0x0800 0000 - 0x080F FFFF            | Flash memory                    | Flash memory                    | Flash memory                    | Flash memory                             | Flash memory                    |
| 0x0400 0000 - 0x07FF FFFF            | Reserved                        | Reserved                        | Reserved                        | FSMC bank 1 NOR/PSRAM 2 (128 MB) Aliased | QUADSPI bank (128 MB) Aliased   |
| 0x0010 0000 - 0x03FF FFFF            | Reserved                        | Reserved                        | Reserved                        | FSMC bank 1 NOR/PSRAM 1 (128 MB) Aliased | QUADSPI bank (128 MB) Aliased   |
| 0x0000 0000 - 0x000F FFFF<br>(1) (2) | Flash (1 MB) Aliased            | SRAM1 (96 KB) Aliased           | System memory (28 KB) Aliased   | FSMC bank 1 NOR/PSRAM 1 (128 MB) Aliased | QUADSPI bank (128 MB) Aliased   |

1. When the FSMC is remapped at address 0x0000 0000, only the first two regions of bank 1 memory controller (bank 1 NOR/PSRAM 1 and NOR/PSRAM 2) can be remapped. When the QUADSPI is remapped at address 0x0000 0000, only 128 MB are remapped. In remap mode, the CPU can access the external memory via ICode bus instead of system bus, which boosts up the performance.
2. Even when aliased in the boot memory space, the related memory is still accessible at its original memory space.

## Embedded boot loader

The embedded boot loader is located in the System memory, programmed by ST during production. Refer to AN2606 STM32 microcontroller system memory boot mode.

### 2.6.2 Boot configuration for STM32L49x/L4Ax devices

In the STM32L49x/L4Ax devices, three different boot modes can be selected through the BOOT0 pin or the nBOOT0 bit into the FLASH\_OPTR register (if the nSWBOOT0 bit is cleared into the FLASH\_OPTR register), and nBOOT1 bit in FLASH\_OPTR register, as shown in the following table.

**Table 6. Boot modes**

| nBOOT1<br>FLASH_OPTR[23] | nBOOT0<br>FLASH_OPTR[27] | BOOT0<br>pin PH3 | nSWBOOT0<br>FLASH_OPTR[26] | Boot Memory Space<br>Alias                                |
|--------------------------|--------------------------|------------------|----------------------------|-----------------------------------------------------------|
| X                        | X                        | 0                | 1                          | Main Flash memory is selected as boot area <sup>(1)</sup> |
| X                        | 1                        | X                | 0                          | Main Flash memory is selected as boot area <sup>(2)</sup> |
| 0                        | X                        | 1                | 1                          | Embedded SRAM1 is selected as boot area                   |
| 0                        | 0                        | X                | 0                          | Embedded SRAM1 is selected as boot area                   |
| 1                        | X                        | 1                | 1                          | System memory is selected as boot area                    |
| 1                        | 0                        | X                | 0                          | System memory is selected as boot area                    |

1. Empty flash will be handled by the bootloader.

2. Empty flash will generate a hard fault.

The values on both BOOT0 pin (coming from the pin or the option bit) and nBOOT1 bit are latched upon reset release. It is up to the user to set nBOOT1 and BOOT0 to select the required boot mode.

The BOOT0 pin or user option bit (depending on the nSWBOOT0 bit value in the FLASH\_OPTR register), and nBOOT1 bit are also re-sampled when exiting from Standby mode. Consequently, they must be kept in the required Boot mode configuration in Standby mode. After this startup delay has elapsed, the CPU fetches the top-of-stack value from address 0x0000 0000, then starts code execution from the boot memory at 0x0000 0004.

Depending on the selected boot mode, main Flash memory, system memory or SRAM1 is accessible as follows:

- Boot from main Flash memory: the main Flash memory is aliased in the boot memory space (0x0000 0000), but still accessible from its original memory space

(0x0800 0000). In other words, the Flash memory contents can be accessed starting from address 0x0000 0000 or 0x0800 0000.

- Boot from system memory: the system memory is aliased in the boot memory space (0x0000 0000), but still accessible from its original memory space (0x1FFF 0000).
- Boot from the embedded SRAM1: the SRAM1 is aliased in the boot memory space (0x0000 0000), but it is still accessible from its original memory space (0x2000 0000).

PH3/BOOT0 GPIO is configured in:

- Input mode during the complete reset phase if the option bit nSWBOOT0 is set into the FLASH\_OPTR register and then switches automatically in analog mode after reset is released (BOOT0 pin).
- Input mode from the reset phase to the completion of the option byte loading if the bit nSWBOOT0 is cleared into the FLASH\_OPTR register (BOOT0 value coming from the option bit). It switches then automatically to the analog mode even if the reset phase is not complete.

**Note:** *When the device boots from SRAM, in the application initialization code, you have to relocate the vector table in SRAM using the NVIC exception table and the offset register.*

When booting from the main Flash memory, the application software can either boot from bank 1 or from bank 2. By default, boot from bank 1 is selected.

To select boot from Flash memory bank 2, set the BFB2 bit in the user option bytes. When this bit is set and the boot pins are in the boot from main Flash memory configuration, the device boots from system memory, and the boot loader jumps to execute the user application programmed in Flash memory bank 2. For further details, please refer to AN2606.

## Physical remap

Once the boot pins mode is selected, the application software can modify the memory accessible in the code area (in this way the code can be executed through the ICode bus in place of the System bus). This modification is performed by programming the [SYSCFG memory remap register \(SYSCFG\\_MEMRMP\)](#) in the SYSCFG controller.

The following memories can thus be remapped:

- Main Flash memory
- System memory
- Embedded SRAM1 (256 KB)
- FSMC bank 1 (NOR/PSRAM 1 and 2)
- QUADSPI memory

**Table 7. Memory mapping versus boot mode/physical remap**

| Addresses                 | Boot/remap in main Flash memory | Boot/remap in embedded SRAM 1   | Boot/remap in system memory     | Remap in FSMC                   | Remap in QUADSPI                |
|---------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|
| 0x2000 0000 - 0x2003 FFFF | SRAM1                           | SRAM1                           | SRAM1                           | SRAM1                           | SRAM1                           |
| 0x1FFF 0000 - 0x1FFF FFFF | System memory/OTP/Options bytes | System memory/OTP/Options bytes | System memory/OTP/Options bytes | System memory/OTP/Options bytes | System memory/OTP/Options bytes |
| 0x1000 8000 - 0x1FFE FFFF | Reserved                        | Reserved                        | Reserved                        | Reserved                        | Reserved                        |

**Table 7. Memory mapping versus boot mode/physical remap (continued)**

| Addresses                            | Boot/remap in main Flash memory | Boot/remap in embedded SRAM 1 | Boot/remap in system memory   | Remap in FSMC                            | Remap in QUADSPI              |
|--------------------------------------|---------------------------------|-------------------------------|-------------------------------|------------------------------------------|-------------------------------|
| 0x1000 0000 - 0x1000 FFFF            | SRAM2                           | SRAM2                         | SRAM2                         | SRAM2                                    | SRAM2                         |
| 0x0810 0000 - 0x0FFF FFFF            | Reserved                        | Reserved                      | Reserved                      | Reserved                                 | Reserved                      |
| 0x0800 0000 - 0x080F FFFF            | Flash memory                    | Flash memory                  | Flash memory                  | Flash memory                             | Flash memory                  |
| 0x0400 0000 - 0x07FF FFFF            | Reserved                        | Reserved                      | Reserved                      | FSMC bank 1 NOR/PSRAM 2 (128 MB) Aliased | QUADSPI bank (128 MB) Aliased |
| 0x0010 0000 - 0x03FF FFFF            | Reserved                        | Reserved                      | Reserved                      | FSMC bank 1 NOR/PSRAM 1 (128 MB) Aliased | QUADSPI bank (128 MB) Aliased |
| 0x0000 0000 - 0x000F FFFF<br>(1) (2) | Flash (1 MB) Aliased            | SRAM1 (256 KB) Aliased        | System memory (28 KB) Aliased | FSMC bank 1 NOR/PSRAM 1 (128 MB) Aliased | QUADSPI bank (128 MB) Aliased |

1. When the FSMC is remapped at address 0x0000 0000, only the first two regions of bank 1 memory controller (bank 1 NOR/PSRAM 1 and NOR/PSRAM 2) can be remapped. When the QUADSPI is remapped at address 0x0000 0000, only 128 MB are remapped. In remap mode, the CPU can access the external memory via ICode bus instead of system bus, which boosts up the performance.
2. Even when aliased in the boot memory space, the related memory is still accessible at its original memory space.

### Embedded boot loader

The embedded boot loader is located in the system memory, programmed by ST during production. Refer to AN2606 STM32 microcontroller system memory boot mode.

## 3 Embedded Flash memory (FLASH)

### 3.1 Introduction

The Flash memory interface manages CPU AHB ICode and DCode accesses to the Flash memory. It implements the erase and program Flash memory operations and the read and write protection mechanisms.

The Flash memory interface accelerates code execution with a system of instruction prefetch and cache lines.

### 3.2 FLASH main features

- Up to 1 Mbyte of Flash memory with dual bank architecture supporting read-while-write capability (RWW).
- Memory organization: 2 banks (Bank 1 and Bank 2)
  - main memory: 512 Kbyte per bank
  - information block: 32 Kbyte per bank
- 72-bit wide data read (64 bits plus 8 ECC bits)
- 72-bit wide data write (64 bits plus 8 ECC bits)
- Page erase (2 Kbyte), bank erase and mass erase (both banks)

Flash memory interface features:

- Flash memory read operations
- Flash memory program/erase operations
- Read protection activated by option (RDP)
- 4 Write protection areas (2 per bank) selected by option (WRP)
- 2 proprietary code read protection areas (1 per bank) selected by option (PCROP)
- Prefetch on ICODE
- Instruction Cache: 32 cache lines of 4 x 64 bits on ICode (1 KB RAM)
- Data Cache: 8 cache lines of 4 x 64 bits on DCode (256B RAM)
- Error Code Correction (ECC): 8 bits for 64-bit double-word
- Option byte loader
- Low-power mode

### 3.3 FLASH functional description

#### 3.3.1 Flash memory organization

The Flash memory is organized as 72-bit wide memory cells (64 bits plus 8 ECC bits) that can be used for storing both code and data constants.

The Flash memory is divided in two banks. Each bank is organized as follows:

- A main memory block containing 256 pages of 2 Kbyte. Each page is made of 8 rows of 256 bytes.
- An Information block containing:
  - System memory from which the device boots in System memory boot mode. The area is reserved for use by STMicroelectronics and contains the boot loader that is used to reprogram the Flash memory through one of the following interfaces: USART1, USART2, USART3, USB (DFU), I2C1, I2C2, I2C3, SPI1, SPI2, SPI3. It is programmed by STMicroelectronics when the device is manufactured, and protected against spurious write/erase operations. For further details, please refer to the AN2606 available from [www.st.com](http://www.st.com).
  - 1 Kbyte (128 double word) OTP (one-time programmable) bytes for user data. The OTP area is available in Bank 1 only. The OTP data cannot be erased and can be written only once. If only one bit is at 0, the entire double word cannot be written anymore, even with the value 0x0000 0000 0000 0000.
  - Option bytes for user configuration.

The memory organization is based on a main area and an information block as shown in [Table 8](#)

**Table 8. Flash module - 1 MB dual bank organization**

| Flash area  |        | Flash memory addresses    | Size (bytes) | Name     |
|-------------|--------|---------------------------|--------------|----------|
| Main memory | Bank 1 | 0x0800 0000 - 0x0800 07FF | 2 K          | Page 0   |
|             |        | 0x0800 0800 - 0x0800 0FFF | 2 K          | Page 1   |
|             |        | 0x0800 1000 - 0x0800 17FF | 2 K          | Page 2   |
|             |        | 0x0800 1800 - 0x0800 1FFF | 2 K          | Page 3   |
|             |        | -                         | -            | -        |
|             |        | -                         | -            | -        |
|             | Bank 2 | 0x0807 F800 - 0x0807 FFFF | 2 K          | Page 255 |
|             |        | 0x0808 0000 - 0x0808 07FF | 2 K          | Page 256 |
|             |        | 0x0808 0800 - 0x0808 0FFF | 2 K          | Page 257 |

|                   |        | -                         | -            | -             |
|                   |        | -                         | -            | -             |
|                   |        | 0x0803 F800 - 0x0803 FFFF | 2 K          | Page 319      |
| Information block | Bank 1 | 0x1FFF 0000 - 0x1FFF 6FFF | 28 K         | System memory |
|                   | Bank 2 | 0x1FFF 8000 - 0x1FFF EFFF | 28 K         |               |
|                   | Bank 1 | 0x1FFF 7000 - 0x1FFF 73FF | 1 K          | OTP area      |
|                   | Bank 1 | 0x1FFF 7800 - 0x1FFF 780F | 16           | Option bytes  |
|                   | Bank 2 | 0x1FFF F800 - 0x1FFF F80F | 16           |               |

1. For 256 KB devices, option DUALBANK=1

### 3.3.2 Error code correction (ECC)

Data in Flash memory are 72-bits words: 8 bits are added per double word (64 bits). The ECC mechanism supports:

- One error detection and correction
- Two errors detection

When one error is detected and corrected, the flag ECCC (ECC correction) is set in [Flash ECC register \(FLASH\\_ECCR\)](#). If ECCCIE is set, an interrupt is generated.

When two errors are detected, a flag ECCD (ECC detection) is set in FLASH\_ECCR register. In this case, a NMI is generated.

When an ECC error is detected, the address of the failing double word and its associated bank are saved in ADDR\_ECC[20:0] and BK\_ECC in the FLASH\_ECCR register. ADDR\_ECC[2:0] are always cleared.

When ECCC or ECCD is set, ADDR\_ECC and BK\_ECC are not updated if a new ECC error occurs. FLASH\_ECCR is updated only when ECC flags are cleared.

**Caution:** When ECCC flag is set, a further two errors detection is not able to generate the NMI. It is therefore recommended to clear ECCC flag as soon as a correction is operated, to preserve ECC error detection capability. Refer to STM32L4 safety manual for the full description of the implications on safety standards compliance.

**Note:** For a virgin data: 0xFF FFFF FFFF FFFF FFFF, one error is detected and corrected but two errors detection is not supported.

When an ECC error is reported, a new read at the failing address may not generate an ECC error if the data is still present in the current buffer, even if ECCC and ECCD are cleared.

### 3.3.3 Read access latency

To correctly read data from Flash memory, the number of wait states (LATENCY) must be correctly programmed in the [Flash access control register \(FLASH\\_ACR\)](#) according to the frequency of the CPU clock (HCLK) and the internal voltage range of the device  $V_{CORE}$ . Refer to [Section 5.1.8: Dynamic voltage scaling management](#). [Table 11](#) shows the correspondence between wait states and CPU clock frequency.

**Table 11. Number of wait states according to CPU clock (HCLK) frequency**

| Wait states (WS)<br>(LATENCY) | HCLK (MHz)                        |                                   |
|-------------------------------|-----------------------------------|-----------------------------------|
|                               | $V_{CORE}$ Range 1 <sup>(1)</sup> | $V_{CORE}$ Range 2 <sup>(2)</sup> |
| 0 WS (1 CPU cycles)           | ≤ 16                              | ≤ 6                               |
| 1 WS (2 CPU cycles)           | ≤ 32                              | ≤ 12                              |
| 2 WS (3 CPU cycles)           | ≤ 48                              | ≤ 18                              |
| 3 WS (4 CPU cycles)           | ≤ 64                              | ≤ 26                              |
| 4 WS (5 CPU cycles)           | ≤ 80                              | ≤ 26                              |

1. Also for SMPS Range1 or SMPS Range2 high.

2. Also for SMPS Range2 low.

After reset, the CPU clock frequency is 4 MHz and 0 wait state (WS) is configured in the FLASH\_ACR register.

When changing the CPU frequency, the following software sequences must be applied in order to tune the number of wait states needed to access the Flash memory:

#### Increasing the CPU frequency:

1. Program the new number of wait states to the LATENCY bits in the [Flash access control register \(FLASH\\_ACR\)](#).
2. Check that the new number of wait states is taken into account to access the Flash memory by reading the FLASH\_ACR register.
3. Modify the CPU clock source by writing the SW bits in the RCC\_CFGR register.
4. If needed, modify the CPU clock prescaler by writing the HPRE bits in RCC\_CFGR.
5. Check that the new CPU clock source or/and the new CPU clock prescaler value is/are taken into account by reading the clock source status (SWS bits) or/and the AHB prescaler value (HPRE bits), respectively, in the RCC\_CFGR register.

**Decreasing the CPU frequency:**

1. Modify the CPU clock source by writing the SW bits in the RCC\_CFGR register.
2. If needed, modify the CPU clock prescaler by writing the HPRE bits in RCC\_CFGR.
3. Check that the new CPU clock source or/and the new CPU clock prescaler value is/are taken into account by reading the clock source status (SWS bits) or/and the AHB prescaler value (HPRE bits), respectively, in the RCC\_CFGR register.
4. Program the new number of wait states to the LATENCY bits in [Flash access control register \(FLASH\\_ACR\)](#).
5. Check that the new number of wait states is used to access the Flash memory by reading the FLASH\_ACR register.

**3.3.4 Adaptive real-time memory accelerator (ART Accelerator™)**

The proprietary Adaptive real-time (ART) memory accelerator is optimized for STM32 industry-standard Arm® Cortex®-M4 with FPU processors. It balances the inherent performance advantage of the Arm® Cortex®-M4 with FPU over Flash memory technologies, which normally requires the processor to wait for the Flash memory at higher operating frequencies.

To release the processor full performance, the accelerator implements an instruction prefetch queue and branch cache which increases program execution speed from the 64-bit Flash memory. Based on CoreMark benchmark, the performance achieved thanks to the ART accelerator is equivalent to 0 wait state program execution from Flash memory at a CPU frequency up to 80 MHz.

**Instruction prefetch**

The Cortex®-M4 fetches the instruction over the ICode bus and the literal pool (constant/data) over the DCode bus. The prefetch block aims at increasing the efficiency of ICode bus accesses.

Each Flash memory read operation provides 64 bits from either two instructions of 32 bits or four instructions of 16 bits according to the program launched. This 64-bits current instruction line is saved in a current buffer. So, in case of sequential code, at least two CPU cycles are needed to execute the previous read instruction line. Prefetch on the ICode bus can be used to read the next sequential instruction line from the Flash memory while the current instruction line is being requested by the CPU.

Prefetch is enabled by setting the PRFTEN bit in the [Flash access control register \(FLASH\\_ACR\)](#). This feature is useful if at least one wait state is needed to access the Flash memory.

[Figure 5](#) shows the execution of sequential 16-bit instructions with and without prefetch when 3 WS are needed to access the Flash memory.

Figure 5. Sequential 16-bit instructions execution

When the code is not sequential (branch), the instruction may not be present in the currently used instruction line or in the prefetched instruction line. In this case (miss), the penalty in terms of number of cycles is at least equal to the number of wait states.

If a loop is present in the current buffer, no new flash access is performed.

### Instruction cache memory (I-Cache)

To limit the time lost due to jumps, it is possible to retain 32 lines of 4\*64 bits in an instruction cache memory. This feature can be enabled by setting the instruction cache enable (ICEN) bit in the [Flash access control register \(FLASH\\_ACR\)](#). Each time a miss occurs (requested data not present in the currently used instruction line, in the prefetched instruction line or in the instruction cache memory), the line read is copied into the instruction cache memory. If some data contained in the instruction cache memory are requested by the CPU, they are provided without inserting any delay. Once all the instruction cache memory lines have been filled, the LRU (least recently used) policy is used to determine the line to replace in the instruction memory cache. This feature is particularly useful in case of code containing loops.

The Instruction cache memory is enable after system reset.

### Data cache memory (D-Cache)

Literal pools are fetched from Flash memory through the DCode bus during the execution stage of the CPU pipeline. Each DCode bus read access fetches 64 bits which are saved in a current buffer. The CPU pipeline is consequently stalled until the requested literal pool is provided. To limit the time lost due to literal pools, accesses through the AHB databus DCode have priority over accesses through the AHB instruction bus ICode.

If some literal pools are frequently used, the data cache memory can be enabled by setting the data cache enable (DCEN) bit in the [Flash access control register \(FLASH\\_ACR\)](#). This feature works like the instruction cache memory, but the retained data size is limited to 8 rows of 4\*64 bits.

The Data cache memory is enable after system reset.

*Note: The D-Cache is active only when data is requested by the CPU (not by DMA1 and DMA2). Data in option bytes block are not cacheable.*

## 3.3.5 Flash program and erase operations

The STM32L47x/L48x/L49x/L4Ax embedded Flash memory can be programmed using in-circuit programming or in-application programming.

The **in-circuit programming (ICP)** method is used to update the entire contents of the Flash memory, using the JTAG, SWD protocol or the boot loader to load the user application into the microcontroller. ICP offers quick and efficient design iterations and eliminates unnecessary package handling or socketing of devices.

In contrast to the ICP method, **in-application programming (IAP)** can use any communication interface supported by the microcontroller (I/Os, USB, CAN, UART, I<sup>2</sup>C, SPI, etc.) to download programming data into memory. IAP allows the user to re-program the Flash memory while the application is running. Nevertheless, part of the application has to have been previously programmed in the Flash memory using ICP.

The contents of the Flash memory are not guaranteed if a device reset occurs during a Flash memory operation.

An on-going Flash memory operation will not block the CPU as long as the CPU does not access the same Flash memory bank. Code or data fetches are possible on one bank while

a write/erase operation is performed to the other bank (refer to [Section 3.3.8: Read-while-write \(RWW\)](#)).

On the contrary, during a program/erase operation to the Flash memory, any attempt to read the same Flash memory bank will stall the bus. The read operation will proceed correctly once the program/erase operation has completed.

### Unlocking the Flash memory

After reset, write is not allowed in the [Flash control register \(FLASH\\_CR\)](#) to protect the Flash memory against possible unwanted operations due, for example, to electric disturbances. The following sequence is used to unlock this register:

1. Write KEY1 = 0x45670123 in the [Flash key register \(FLASH\\_KEYR\)](#)
2. Write KEY2 = 0xCDEF89AB in the FLASH\_KEYR register.

Any wrong sequence will lock up the FLASH\_CR register until the next system reset. In the case of a wrong key sequence, a bus error is detected and a Hard Fault interrupt is generated.

The FLASH\_CR register can be locked again by software by setting the LOCK bit in the FLASH\_CR register.

**Note:** *The FLASH\_CR register cannot be written when the BSY bit in the [Flash status register \(FLASH\\_SR\)](#) is set. Any attempt to write to it with the BSY bit set will cause the AHB bus to stall until the BSY bit is cleared.*

### 3.3.6 Flash main memory erase sequences

The Flash memory erase operation can be performed at page level, bank level or on the whole Flash memory (Mass Erase). Mass Erase does not affect the Information block (system flash, OTP and option bytes).

#### Page erase

To erase a page (2 Kbyte), follow the procedure below:

1. Check that no Flash memory operation is ongoing by checking the BSY bit in the [Flash status register \(FLASH\\_SR\)](#).
2. Check and clear all error programming flags due to a previous programming. If not, PGSERR is set.
3. Set the PER bit and select the page you wish to erase (PNB) with the associated bank (BKER) in the [Flash control register \(FLASH\\_CR\)](#).
4. Set the STRT bit in the FLASH\_CR register.
5. Wait for the BSY bit to be cleared in the FLASH\_SR register.

**Note:** *The internal oscillator HSI16 (16 MHz) is enabled automatically when STRT bit is set, and disabled automatically when STRT bit is cleared, except if the HSI16 is previously enabled with HSION in RCC\_CR register.*

*If the page erase is part of write-protected area (by WRP or PCROP), WRPERR is set and the page erase request is aborted.*

#### Bank 1, Bank 2 or both banks Mass erase

To perform a bank Mass Erase, follow the procedure below:

1. Check that no Flash memory operation is ongoing by checking the BSY bit in the FLASH\_SR register.
2. Check and clear all error programming flags due to a previous programming. If not, PGSERR is set.
3. Set the MER1 bit or/and MER2 (depending on the bank) in the *Flash control register (FLASH\_CR)*. Both banks can be selected in the same operation.
4. Set the STRT bit in the FLASH\_CR register.
5. Wait for the BSY bit to be cleared in the *Flash status register (FLASH\_SR)*.

**Note:** *The internal oscillator HSI16 (16 MHz) is enabled automatically when STRT bit is set, and disabled automatically when STRT bit is cleared, except if the HSI16 is previously enabled with HSION in RCC\_CR register.*

*If the bank to erase or if one of the banks to erase contains a write-protected area (by WRP or PCROP), WRPERR is set and the mass erase request is aborted (for both banks if both are selected).*

### 3.3.7 Flash main memory programming sequences

The Flash memory is programmed 72 bits at a time (64 bits + 8 bits ECC).

Programming in a previously programmed address is not allowed except if the data to write is full zero, and any attempt will set PROGERR flag in the *Flash status register (FLASH\_SR)*.

It is only possible to program double word (2 x 32-bit data).

- Any attempt to write byte or half-word will set SIZERR flag in the FLASH\_SR register.
- Any attempt to write a double word which is not aligned with a double word address will set PGAERR flag in the FLASH\_SR register.

#### Standard programming

The Flash memory programming sequence in standard mode is as follows:

1. Check that no Flash main memory operation is ongoing by checking the BSY bit in the *Flash status register (FLASH\_SR)*.
2. Check and clear all error programming flags due to a previous programming. If not, PGSERR is set.
3. Set the PG bit in the *Flash control register (FLASH\_CR)*.
4. Perform the data write operation at the desired memory address, inside main memory block or OTP area. Only double word can be programmed.
  - Write a first word in an address aligned with double word
  - Write the second word
5. Wait until the BSY bit is cleared in the FLASH\_SR register.
6. Check that EOP flag is set in the FLASH\_SR register (meaning that the programming operation has succeed), and clear it by software.
7. Clear the PG bit in the FLASH\_CR register if there no more programming request anymore.

**Note:** *When the flash interface has received a good sequence (a double word), programming is automatically launched and BSY bit is set. The internal oscillator HSI16 (16 MHz) is enabled*

automatically when PG bit is set, and disabled automatically when PG bit is cleared, except if the HSI16 is previously enabled with HSION in RCC\_CR register.

If the user needs to program only one word, double word must be completed with the erase value 0xFFFF FFFF to launch automatically the programming.

ECC is calculated from the double word to program.

### Fast programming

This mode allows to program a row (32 double word) and to reduce the page programming time by eliminating the need for verifying the flash locations before they are programmed and to avoid rising and falling time of high voltage for each double word. During fast programming, the CPU clock frequency (HCLK) must be at least 8 MHz.

Only the main memory can be programmed in Fast programming mode.

The Flash main memory programming sequence in standard mode is as follows:

1. Perform a mass erase of the bank to program. If not, PGSERR is set.
2. Check that no Flash main memory operation is ongoing by checking the BSY bit in the [Flash status register \(FLASH\\_SR\)](#).
3. Check and clear all error programming flag due to a previous programming.
4. Set the FSTPG bit in [Flash control register \(FLASH\\_CR\)](#).
5. Write the 32 double words to program a row. Only double words can be programmed:
  - Write a first word in an address aligned with double word
  - Write the second word.
6. Wait until the BSY bit is cleared in the FLASH\_SR register.
7. Check that EOP flag is set in the FLASH\_SR register (meaning that the programming operation has succeed), and clear it by software.
8. Clear the FSTPG bit in the FLASH\_CR register if there no more programming request anymore.

**Note:** *If the flash is attempted to be written in Fast programming mode while a read operation is on going in the same bank, the programming is aborted without any system notification (no error flag is set).*

*When the Flash interface has received the first double word, programming is automatically launched. The BSY bit is set when the high voltage is applied for the first double word, and it is cleared when the last double word has been programmed or in case of error. The internal oscillator HSI16 (16 MHz) is enabled automatically when FSTPG bit is set, and disabled automatically when FSTPG bit is cleared, except if the HSI16 is previously enabled with HSION in RCC\_CR register.*

*The 32 double word must be written successively. The high voltage is kept on the flash for all the programming. Maximum time between two double words write requests is the time programming (around 20us). If a second double word arrives after this time programming, fast programming is interrupted and MISSERR is set.*

*High voltage mustn't exceed 8 ms for a full row between 2 erases. This is guaranteed by the sequence of 32 double words successively written with a clock system greater or equal to 8MHz. An internal time-out counter counts 7ms when Fast programming is set and stops the programming when time-out is over. In this case the FASTERR bit is set.*

*If an error occurs, high voltage is stopped and next double word to programmed is not programmed. Anyway, all previous double words have been properly programmed.*

## Programming errors

Several kind of errors can be detected. In case of error, the Flash operation (programming or erasing) is aborted.

- **PROGERR**: Programming Error  
In standard programming: PROGERR is set if the word to write is not previously erased (except if the value to program is full zero).
- **SIZERR**: Size Programming Error  
In standard programming or in fast programming: only double word can be programmed and only 32-bit data can be written. SIZERR is set if a byte or an half-word is written.
- **PGAERR**: Alignment Programming error  
PGAERR is set if one of the following conditions occurs:
  - In standard programming: the first word to be programmed is not aligned with a double word address, or the second word doesn't belong to the same double word address.
  - In fast programming: the data to program doesn't belong to the same row than the previous programmed double words, or the address to program is not greater than the previous one.
- **PGSERR**: Programming Sequence Error  
PGSERR is set if one of the following conditions occurs:
  - In the standard programming sequence or the fast programming sequence: a data is written when PG and FSTPG are cleared.
  - In the standard programming sequence or the fast programming sequence: MER1, MER2, and PER are not cleared when PG or FSTPG is set.
  - In the fast programming sequence: the Mass erase is not performed before setting FSTPG bit.
  - In the mass erase sequence: PG, FSTPG, and PER are not cleared when MER1 or MER2 is set.
  - In the page erase sequence: PG, FSTPG, MER1 and MER2 are not cleared when PER is set.
  - PGSERR is set also if PROGERR, SIZERR, PGAERR, MISSERR, FASTERR or PGSERR is set due to a previous programming error.
- **WRPERR**: Write Protection Error  
WRPERR is set if one of the following conditions occurs:
  - Attempt to program or erase in a write protected area (WRP) or in a PCROP area.
  - Attempt to perform a bank erase when one page or more is protected by WRP or PCROP.
  - The debug features are connected or the boot is executed from SRAM or from System flash when the read protection (RDP) is set to Level 1.
  - Attempt to modify the option bytes when the read protection (RDP) is set to Level 2.
- **MISSERR**: Fast Programming Data Miss Error  
In fast programming: all the data must be written successively. MISSERR is set if the previous data programming is finished and the next data to program is not written yet.
- **FASTERR**: Fast Programming Error

In fast programming: FASTERR is set if one of the following conditions occurs:

- When FSTPG bit is set for more than 7ms which generates a time-out detection.
- When the row fast programming has been interrupted by a MISSERR, PGAERR, WRPERR or SIZERR.

If an error occurs during a program or erase operation, one of the following error flags is set in the FLASH\_SR register:

PROGERR, SIZERR, PGAERR, PGSERR, MISSERR (Program error flags),  
WRPERR (Protection error flag)

In this case, if the error interrupt enable bit ERRIE is set in the *Flash status register (FLASH\_SR)*, an interrupt is generated and the operation error flag OPERR is set in the FLASH\_SR register.

*Note: If several successive errors are detected (for example, in case of DMA transfer to the Flash memory), the error flags cannot be cleared until the end of the successive write requests.*

### Programming and caches

If a Flash memory write access concerns some data in the data cache, the Flash write access modifies the data in the Flash memory and the data in the cache.

If an erase operation in Flash memory also concerns data in the data or instruction cache, you have to make sure that these data are rewritten before they are accessed during code execution. If this cannot be done safely, it is recommended to flush the caches by setting the DCRST and ICRST bits in the *Flash access control register (FLASH\_ACR)*.

*Note: The I/D cache should be flushed only when it is disabled (I/DCEN = 0).*

### 3.3.8 Read-while-write (RWW)

The Flash memory is divided into two banks allowing read-while-write operations. This feature allows to perform a read operation from one bank while an erase or program operation is performed to the other bank.

*Note: Write-while-write operations are not allowed. As an example, It is not possible to perform an erase operation on one bank while programming the other one.*

#### Read from bank 1 while page erasing in bank 2 (or vice versa)

While executing a program code from bank 1, it is possible to perform a page erase operation on bank 2 (and vice versa). Follow the procedure below:

1. Check that no Flash memory operation is ongoing by checking the BSY bit in the *Flash status register (FLASH\_SR)* (BSY is active when erase/program operation is on going in bank 1 or bank 2).
2. Set PER bit, PSB to select the page and BKER to select the bank in the *Flash control register (FLASH\_CR)*.
3. Set the STRT bit in the FLASH\_CR register.
4. Wait for the BSY bit to be cleared (or use the EOP interrupt).

#### Read from bank 1 while mass erasing bank 2 (or vice versa)

While executing a program code from bank 1, it is possible to perform a mass erase operation on bank 2 (and vice versa). Follow the procedure below:

1. Check that no Flash memory operation is ongoing by checking the BSY bit in the *Flash status register (FLASH\_SR)* (BSY is active when erase/program operation is on going in bank 1 or bank 2).
2. Set MER1 or MER2 to in the *Flash control register (FLASH\_CR)*.
3. Set the STRT bit in the FLASH\_CR register.
4. Wait for the BSY bit to be cleared (or use the EOP interrupt).

#### **Read from bank 1 while programming bank 2 (or vice versa)**

While executing a program code from bank 1, it is possible to perform a program operation on the bank 2. (and vice versa). Follow the procedure below:

1. Check that no Flash memory operation is ongoing by checking the BSY bit in the *Flash status register (FLASH\_SR)* (BSY is active when erase/program operation is on going on bank 1 or bank 2).
2. Set the PG bit in the *Flash control register (FLASH\_CR)*.
3. Perform the data write operations at the desired address memory inside the main memory block or OTP area.
4. Wait for the BSY bit to be cleared (or use the EOP interrupt).

## 3.4 FLASH option bytes

### 3.4.1 Option bytes description

The option bytes are configured by the end user depending on the application requirements. As a configuration example, the watchdog may be selected in hardware or software mode (refer to [Section 3.4.2: Option bytes programming](#)).

A double word is split up as follows in the option bytes:

**Table 12. Option byte format**

| 63-56                      | 55-48                      | 47-40                      | 40-32                      | 31-24         | 23-16         | 15 -8         | 7-0           |
|----------------------------|----------------------------|----------------------------|----------------------------|---------------|---------------|---------------|---------------|
| Complemented option byte 3 | Complemented option byte 2 | Complemented option byte 1 | Complemented option byte 0 | Option byte 3 | Option byte 2 | Option byte 1 | Option byte 0 |

The organization of these bytes inside the information block is as shown in [Table 13: Option byte organization](#).

The option bytes can be read from the memory locations listed in [Table 13: Option byte organization](#) or from the Option byte registers:

- [Flash option register \(FLASH\\_OPTR\)](#)
- [Flash Bank 1 PCROP Start address register \(FLASH\\_PCROP1SR\)](#)
- [Flash Bank 1 PCROP End address register \(FLASH\\_PCROP1ER\)](#)
- [Flash Bank 1 WRP area A address register \(FLASH\\_WRP1AR\)](#)
- [Flash Bank 1 WRP area B address register \(FLASH\\_WRP1BR\)](#)
- [Flash Bank 2 PCROP Start address register \(FLASH\\_PCROP2SR\)](#)
- [Flash Bank 2 PCROP End address register \(FLASH\\_PCROP2ER\)](#)
- [Flash Bank 2 WRP area A address register \(FLASH\\_WRP2AR\)](#)
- [Flash Bank 2 WRP area B address register \(FLASH\\_WRP2BR\)](#)

**Table 13. Option byte organization**

| BANK   | Address  | 63        | [62:56] | [55:48]   | [47:40]     | [39:32]    | 31     | [30:24]  | [23:16]   | [15:8] | [7:0]       |     |
|--------|----------|-----------|---------|-----------|-------------|------------|--------|----------|-----------|--------|-------------|-----|
| Bank 1 | 1FFF7800 | USER OPT  |         |           |             | RDP        |        | USER OPT |           |        |             | RDP |
|        | 1FFF7808 | Unused    |         |           | PCROP1_STRT |            |        | Unused   |           |        | PCROP1_STRT |     |
|        | 1FFF7810 | PCROP_RDP | Unused  |           |             | PCROP1_END |        |          | PCROP_RDP | Unused |             |     |
|        | 1FFF7818 | Unused    |         | WRP1A_END | Unused      | WRP1A_STRT | Unused |          | WRP1A_END | Unused | WRP1A_STRT  |     |
|        | 1FFF7820 | Unused    |         | WRP1B_END | Unused      | WRP1B_STRT | Unused |          | WRP1B_END | Unused | WRP1B_STRT  |     |

Table 13. Option byte organization (continued)

| BANK   | Address  | 63     | [62:56]   | [55:48] | [47:40]     | [39:32]    | 31     | [30:24] | [23:16]   | [15:8]      | [7:0]      |
|--------|----------|--------|-----------|---------|-------------|------------|--------|---------|-----------|-------------|------------|
| Bank 2 | 1FFFF800 | Unused |           |         |             |            | Unused |         |           |             |            |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **nBOOT0**: nBOOT0 option bit (this bit is reserved for STM32L47x/L48x devices)

0: nBOOT0 = 0

1: nBOOT0 = 1

Bit 26 **nSWBOOT0**: Software BOOT0 (this bit is reserved for STM32L47x/L48x devices)

0: BOOT0 taken from the option bit nBOOT0

1: BOOT0 taken from PH3/BOOT0 pin

Bit 25 **SRAM2\_RST**: SRAM2 Erase when system reset

0: SRAM2 erased when a system reset occurs

1: SRAM2 is not erased when a system reset occurs

Bit 24 **SRAM2\_PE**: SRAM2 parity check enable

0: SRAM2 parity check enable

1: SRAM2 parity check disable

Bit 23 **nBOOT1**: Boot configuration

Together with the BOOT0 pin, this bit selects boot mode from the Flash main memory, SRAM1 or the System memory. Refer to [Section 2.6: Boot configuration](#).

Bit 22 Reserved, must be kept at reset value.

Bit 21 **DUALBANK**: Dual-Bank on 512 KB or 256 KB Flash memory devices

0: 256 KB/512 KB Single-bank Flash: Contiguous addresses in Bank 1

1: 256 KB/512 KB Dual-bank Flash: Refer to [Table 9](#) and [Table 10](#)

- Bit 20 **BFB2**: Dual-bank boot  
 0: Dual-bank boot disable  
 1: Dual-bank boot enable
- Bit 19 **WWDG\_SW**: Window watchdog selection  
 0: Hardware window watchdog  
 1: Software window watchdog
- Bit 18 **IWDG\_STDBY**: Independent watchdog counter freeze in Standby mode  
 0: Independent watchdog counter is frozen in Standby mode  
 1: Independent watchdog counter is running in Standby mode
- Bit 17 **IWDG\_STOP**: Independent watchdog counter freeze in Stop mode  
 0: Independent watchdog counter is frozen in Stop mode  
 1: Independent watchdog counter is running in Stop mode
- Bit 16 **IDWG\_SW**: Independent watchdog selection  
 0: Hardware independent watchdog  
 1: Software independent watchdog
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **nRST\_SHDW**  
 0: Reset generated when entering the Shutdown mode  
 1: No reset generated when entering the Shutdown mode
- Bit 13 **nRST\_STDBY**  
 0: Reset generated when entering the Standby mode  
 1: No reset generate when entering the Standby mode
- Bit 12 **nRST\_STOP**  
 0: Reset generated when entering the Stop mode  
 1: No reset generated when entering the Stop mode
- Bit 11 Reserved, must be kept at reset value.
- Bits10:8 **BOR\_LEV**: BOR reset Level  
 These bits contain the VDD supply level threshold that activates/releases the reset.  
 000: BOR Level 0. Reset level threshold is around 1.7 V  
 001: BOR Level 1. Reset level threshold is around 2.0 V  
 010: BOR Level 2. Reset level threshold is around 2.2 V  
 011: BOR Level 3. Reset level threshold is around 2.5 V  
 100: BOR Level 4. Reset level threshold is around 2.8 V
- Bits 7:0 **RDP**: Read protection level  
 0xAA: Level 0, read protection not active  
 0xCC: Level 2, chip read protection active  
 Others: Level 1, memories read protection active

### Bank 1 PCROP Start address option bytes

Flash memory address: 0x1FFF 7808

ST production value: 0xFFFF FFFF

| r                 | r  | r  | r  | r  | r  | r | r | r | r | r | r | r | r | r | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PCROP1\_STRT**: Bank 1 PCROP area start offset

PCROP1\_STRT contains the first double-word of the bank 1 PCROP area.

### Bank 1 PCROP End address option bytes

Flash memory address: 0x1FFF 7810

ST production value: 0xFFFF 0000

|                  |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

| 15               | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| PCROP1_END[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| r                | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bit 31 **PCROP\_RDP**: PCROP area preserved when RDP level decreased

This bit is set only. It is reset after a full mass erase due to a change of RDP from Level 1 to Level 0.

0: PCROP area is not erased when the RDP level is decreased from Level 1 to Level 0.

1: PCROP area is erased when the RDP level is decreased from Level 1 to Level 0 (full mass erase).

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **PCROP1\_END**: Bank 1 PCROP area end offset

PCROP1\_END contains the last double-word of the bank 1 PCROP area.

### Bank 1 WRP Area A address option bytes

Flash memory address: 0x1FFF 7818

ST production value: 0xFF00 FFFF

|      |      |      |      |      |      |      |      |                 |    |    |    |    |    |    |    |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **WRP1A\_END**: Bank 1 WRP first area “A” end offset

WRP1A\_END contains the last page of the Bank 1 WRP first area.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **WRP1A\_STRT**: Bank 1 WRP first area “A” start offset

WRP1A\_STRT contains the first page of the Bank 1 WRP first area.

### Bank 1 WRP Area B address option bytes

Flash memory address: 0x1FFF 7820

ST production value: 0xFF00 FFFF

|      |      |      |      |      |      |      |      |                 |    |    |    |    |    |    |    |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **WRP2A\_END**: Bank 2 WRP first area "A" end offset

WRP2A\_END contains the last page of the Bank 2 WRP first area.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **WRP2A\_STRT**: Bank 2 WRP first area "A" start offset

WRP2A\_STRT contains the first page of the Bank 2 WRP first area.

### Bank 2 WRP Area B address option bytes

Flash memory address: 0x1FFF F820

ST production value: 0xFF00FFFF

|      |      |      |      |      |      |      |      |                  |    |    |    |    |    |    |    |
|------|------|------|------|------|------|------|------|------------------|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23               | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | WRP2B_END[15:0]  |    |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      | r                | r  | r  | r  | r  | r  | r  | r  |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7                | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | WRP2B_STRT[15:0] |    |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      | r                | r  | r  | r  | r  | r  | r  | r  |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **WRP2B\_END**: Bank 2 WRP first area “B” end offset  
WRP2B\_END contains the last page of the Bank 2 WRP second area.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **WRP2B\_STRT**: Bank 2 WRP first area “B” start offset  
WRP2B\_STRT contains the first page of the Bank 2 WRP second area.

### 3.4.2 Option bytes programming

After reset, the options related bits in the *Flash control register (FLASH\_CR)* are write-protected. To run any operation on the option bytes page, the option lock bit OPTLOCK in the *Flash control register (FLASH\_CR)* must be cleared. The following sequence is used to unlock this register:

1. Unlock the FLASH\_CR with the LOCK clearing sequence (refer to *Unlocking the Flash memory*).
2. Write OPTKEY1 = 0x08192A3B in the *Flash option key register (FLASH\_OPTKEYR)*.
3. Write OPTKEY2 = 0x4C5D6E7F in the FLASH\_OPTKEYR register.

The user options can be protected against unwanted erase/program operations by setting the OPTLOCK bit by software.

*Note:* If LOCK is set by software, OPTLOCK is automatically set too.

#### Modifying user options

The option bytes are programmed differently from a main memory user address. It is not possible to modify independently user options of bank 1 or bank 2. The users Options of the bank 1 are modified first.

To modify the user options value, follow the procedure below:

1. Check that no Flash memory operation is on going by checking the BSY bit in the *Flash status register (FLASH\_SR)*.
2. Clear OPTLOCK option lock bit with the clearing sequence described above.
3. Write the desired options value in the options registers: *Flash option register (FLASH\_OPTR)*, *Flash Bank 1 PCROP Start address register (FLASH\_PCROP1SR)*, *Flash Bank 1 PCROP End address register (FLASH\_PCROP1ER)*, *Flash Bank 1 WRP area A address register (FLASH\_WRP1AR)*, *Flash Bank 1 WRP area B address register (FLASH\_WRP1BR)*, *Flash Bank 2 PCROP Start address register (FLASH\_PCROP2SR)*, *Flash Bank 2 PCROP End address register (FLASH\_PCROP2ER)*, *Flash Bank 2 WRP area A address register (FLASH\_WRP2AR)*, *Flash Bank 2 WRP area B address register (FLASH\_WRP2BR)*.
4. Set the Options Start bit OPTSTRT in the *Flash control register (FLASH\_CR)*.
5. Wait for the BSY bit to be cleared.

*Note:* Any modification of the value of one option is automatically performed by erasing both user option bytes pages first (bank 1 and bank 2) and then programming all the option bytes with the values contained in the flash option registers.

### Option byte loading

After the BSY bit is cleared, all new options are updated into the flash but they are not applied to the system. They will have effect on the system when they are loaded. Option bytes loading (OBL) is performed in two cases:

- when OBL\_LAUNCH bit is set in the [Flash control register \(FLASH\\_CR\)](#).
- after a power reset (BOR reset or exit from Standby/Shutdown modes).

Option byte loader performs a read of the options block and stores the data into internal option registers. These internal registers configure the system and cannot be read with by software. Setting OBL\_LAUNCH generates a reset so the option byte loading is performed under system reset.

Each option bit has also its complement in the same double word. During option loading, a verification of the option bit and its complement allows to check the loading has correctly taken place.

During option byte loading, the options are read by double word with ECC. If the word and its complement are matching, the option word/byte is copied into the option register.

If the comparison between the word and its complement fails, a status bit OPTVERR is set. Mismatch values are forced into the option registers:

- For USR OPT option, the value of mismatch is all options at '1', except for BOR\_LEV which is "000" (lowest threshold)
- For WRP option, the value of mismatch is the default value "No protection"
- For RDP option, the value of mismatch is the default value "Level 1"
- For PCROP, the value of mismatch is "all memory protected"

On system reset rising, internal option registers are copied into option registers which can be read and written by software (FLASH\_OPTR, FLASH\_PCROP1/2SR, FLASH\_PCROP1/2ER, FLASH\_WRP1/2AR, FLASH\_WRP1/2BR). These registers are also used to modify options. If these registers are not modified by user, they reflect the options states of the system. See [Section : Modifying user options](#) for more details.

## 3.5 FLASH memory protection

The Flash main memory can be protected against external accesses with the Read protection (RDP). The pages of the Flash memory can also be protected against unwanted write due to loss of program counter contexts. The write-protection (WRP) granularity is one page (2 KByte). Apart of the flash memory can also be protected against read and write from third parties (PCROP). The PCROP granularity is double word (64-bit).

### 3.5.1 Read protection (RDP)

The read protection is activated by setting the RDP option byte and then, by applying a system reset to reload the new RDP option byte. The read protection protects to the Flash main memory, the option bytes, the backup registers (RTC\_BKPxR in the RTC) and the SRAM2.

*Note:* When protection Level 1 is set through boot from RAM, bootloader or debugger, a power-down or a standby is required to execute the user code.

There are three levels of read protection from no protection (level 0) to maximum protection or no debug (level 2).

The Flash memory is protected when the RDP option byte and its complement contain the pair of values shown in [Table 14](#).

**Table 14. Flash memory read protection status**

| RDP byte value                | RDP complement value                                           | Read protection level |
|-------------------------------|----------------------------------------------------------------|-----------------------|
| 0xAA                          | 0x55                                                           | Level 0               |
| Any value except 0xAA or 0xCC | Any value (not necessarily complementary) except 0x55 and 0x33 | Level 1               |
| 0xCC                          | 0x33                                                           | Level 2               |

The System memory area is read accessible whatever the protection level. It is never accessible for program/erase operation.

#### Level 0: no protection

Read, program and erase operations into the Flash main memory area are possible. The option bytes, the SRAM2 and the backup registers are also accessible by all operations.

### Level 1: Read protection

This is the default protection level when RDP option byte is erased. It is defined as well when RDP value is at any value different from 0xAA and 0xCC, or even if the complement is not correct.

- **User mode:** Code executing in user mode (**Boot Flash**) can access Flash main memory, option bytes, SRAM2 and backup registers with all operations.
- **Debug, boot RAM and boot loader modes:** In debug mode or when code is running from boot RAM or boot loader, the Flash main memory, the backup registers (RTC\_BKPxR in the RTC) and the SRAM2 are totally inaccessible. In these modes, a read or write access to the Flash generates a bus error and a Hard Fault interrupt.

**Caution:** In case the Level 1 is configured and no PCROP area is defined, it is mandatory to set PCROP\_RDP bit to 1 (full mass erase when the RDP level is decreased from Level 1 to Level 0). In case the Level 1 is configured and a PCROP area is defined, if user code needs to be protected by RDP but not by PCROP, it must not be placed in a page containing a PCROP area.

### Level 2: No debug

In this level, the protection level 1 is guaranteed. In addition, the Cortex®-M4 debug port, the boot from RAM (boot RAM mode) and the boot from System memory (boot loader mode) are no more available. In user execution mode (boot FLASH mode), all operations are allowed on the Flash Main memory. On the contrary, only read operations can be performed on the option bytes.

Option bytes cannot be programmed nor erased. Thus, the level 2 cannot be removed at all: it is an irreversible operation. When attempting to modify the options bytes, the protection error flag WRPER is set in the FLASH\_SR register and an interrupt can be generated.

**Note:** *The debug feature is also disabled under reset.*

*STMicroelectronics is not able to perform analysis on defective parts on which the level 2 protection has been set.*

### Changing the Read protection level

It is easy to move from level 0 to level 1 by changing the value of the RDP byte to any value (except 0xCC). By programming the 0xCC value in the RDP byte, it is possible to go to level 2 either directly from level 0 or from level 1. Once in level 2, it is no more possible to modify the Read protection level.

When the RDP is reprogrammed to the value 0xAA to move from Level 1 to Level 0, a mass erase of the Flash main memory is performed if PCROP\_RDP is set in the [Flash Bank 1 PCROP End address register \(FLASH\\_PCROP1ER\)](#). The backup registers (RTC\_BKPxR in the RTC) and the SRAM2 are also erased. The user options except PCROP protection are set to their previous values copied from FLASH\_OTPR, FLASH\_WRPxyR (x=1, 2 and y=A or B). PCROP is disable. The OTP area is not affected by mass erase and remains unchanged.

If the bit PCROP\_RDP is cleared in the FLASH\_PCROP1ER, the full mass erase is replaced by a partial mass erase that is successive page erases in the bank where PCROP is active, except for the pages protected by PCROP. This is done in order to keep the PCROP code. If PCROP is active for both banks, both banks are erased by page erases. Only when both banks are erased, options are re-programmed with their previous values. This is also true for FLASH\_PCROPxSR and FLASH\_PCROPxER registers (x=1,2).

**Note:** Full Mass Erase or Partial Mass Erase is performed only when Level 1 is active and Level 0 requested. When the protection level is increased (0->1, 1->2, 0->2) there is no mass erase. To validate the protection level change, the option bytes must be reloaded through the OBL\_LAUNCH bit in Flash control register.

Figure 6. Changing the Read protection (RDP) level

Table 15. Access status versus protection level and execution modes

| Area                         | Protection level | User execution (BootFromFlash) |                    |       | Debug/ BootFromRam/ BootFromLoader <sup>(1)</sup> |                    |                   |
|------------------------------|------------------|--------------------------------|--------------------|-------|---------------------------------------------------|--------------------|-------------------|
|                              |                  | Read                           | Write              | Erase | Read                                              | Write              | Erase             |
| Flash main memory            | 1                | Yes                            | Yes                | Yes   | No                                                | No                 | No <sup>(3)</sup> |
|                              | 2                | Yes                            | Yes                | Yes   | N/A                                               | N/A                | N/A               |
| System memory <sup>(2)</sup> | 1                | Yes                            | No                 | No    | Yes                                               | No                 | No                |
|                              | 2                | Yes                            | No                 | No    | N/A                                               | N/A                | N/A               |
| Option bytes                 | 1                | Yes                            | Yes <sup>(3)</sup> | Yes   | Yes                                               | Yes <sup>(3)</sup> | Yes               |
|                              | 2                | Yes                            | No                 | No    | N/A                                               | N/A                | N/A               |

Table 15. Access status versus protection level and execution modes (continued)

| Area             | Protection level | User execution (BootFromFlash) |                    |       | Debug/ BootFromRam/ BootFromLoader <sup>(1)</sup> |       |                   |
|------------------|------------------|--------------------------------|--------------------|-------|---------------------------------------------------|-------|-------------------|
|                  |                  | Read                           | Write              | Erase | Read                                              | Write | Erase             |
| OTP              | 1                | Yes                            | Yes <sup>(4)</sup> | N/A   | No                                                | No    | N/A               |
|                  | 2                | Yes                            | Yes <sup>(4)</sup> | N/A   | N/A                                               | N/A   | N/A               |
| Backup registers | 1                | Yes                            | Yes                | N/A   | No                                                | No    | No <sup>(5)</sup> |
|                  | 2                | Yes                            | Yes                | N/A   | N/A                                               | N/A   | N/A               |
| SRAM2            | 1                | Yes                            | Yes                | N/A   | No                                                | No    | No <sup>(6)</sup> |
|                  | 2                | Yes                            | Yes                | N/A   | N/A                                               | N/A   | N/A               |

1. When the protection level 2 is active, the Debug port, the boot from RAM and the boot from system memory are disabled.
2. The system memory is only read-accessible, whatever the protection level (0, 1 or 2) and execution mode.
3. The Flash main memory is erased when the RDP option byte is programmed with all level protections disabled (0xAA).
4. OTP can only be written once.
5. The backup registers are erased when RDP changes from level 1 to level 0.
6. The SRAM2 is erased when RDP changes from level 1 to level 0.

### 3.5.2 Proprietary code readout protection (PCROP)

Apart of the flash memory can be protected against read and write from third parties. The protected area is execute-only: it can only be reached by the STM32 CPU, as an instruction code, while all other accesses (DMA, debug and CPU data read, write and erase) are strictly prohibited. One area per bank can be selected, with double word (64-bit) granularity. An additional option bit (PCROP\_RDP) allows to select if the PCROP area is erased or not when the RDP protection is changed from Level 1 to Level 0 (refer to [Changing the Read protection level](#)).

Each PCROP area is defined by a start page offset and an end page offset related to the physical Flash bank base address. These offsets are defined in the PCROP address registers [Flash Bank 1 PCROP Start address register \(FLASH\\_PCROP1SR\)](#), [Flash Bank 1 PCROP End address register \(FLASH\\_PCROP1ER\)](#), [Flash Bank 2 PCROP Start address register \(FLASH\\_PCROP2SR\)](#), [Flash Bank 2 PCROP End address register \(FLASH\\_PCROP2ER\)](#).

The Bank “x” PCROP (x=1,2) area is defined from the address: *Bank “x” Base address + [PCROP<sub>x</sub>\_STRT x 0x8] (included)* to the address: *Bank “x” Base address + [(PCROP<sub>x</sub>\_END+1) x 0x8] (excluded)*. The minimum PCROP area size is two double-words (128 bits).

For example, to protect by PCROP from the address 0x0806 2F80 (included) to the address 0x0807 0004 (included):

- if boot in flash is done in Bank 1, FLASH\_PCROP1SR and FLASH\_PCROP1ER registers must be programmed with:
  - PCROP1\_STRT = 0xC5F0.
  - PCROP1\_END = 0xE000.
- If the two banks are swapped, the protection must apply to bank 2, and FLASH\_PCROP2SR and FLASH\_PCROP2ER register must be programmed with:
  - PCROP2\_STRT = 0xC5F0.
  - PCROP2\_END = 0xE000.

Any read access performed through the D-bus to a PCROP protected area will trigger RDERR flag error.

Any PCROP protected address is also write protected and any write access to one of these addresses will trigger WRPERR.

Any PCROP area is also erase protected. Consequently, any erase to a page in this zone is impossible (including the page containing the start address and the end address of this zone). Moreover, a software mass erase cannot be performed if one zone is PCROP protected.

For previous example, due to erase by page, all pages from page 0xC5 to 0xE0 are protected in case of page erase. (All addresses from 0x0806 2800 to 0x0807 07FF can't be erased).

Deactivation of PCROP can only occurs when the RDP is changing from level 1 to level 0. If the user options modification tries to clear PCROP or to decrease the PCROP area, the options programming is launched but PCROP area stays unchanged. On the contrary, it is possible to increase the PCROP area.

When option bit PCROP\_RDP is cleared, when the RDP is changing from level 1 to level 0, Full Mass Erase is replaced by Partial Mass Erase in order to keep the PCROP area (refer to [Changing the Read protection level](#)). In this case, PCROP1/2\_STRT and PCROP1/2\_END are also not erased.

**Note:** *It is recommended to align PCROP area with page granularity when using PCROP\_RDP, or to leave free the rest of the page where PCROP zone starts or ends.*

### 3.5.3 Write protection (WRP)

The user area in Flash memory can be protected against unwanted write operations. Two write-protected (WRP) areas can be defined in each bank, with page (2 KByte) granularity. Each area is defined by a start page offset and an end page offset related to the physical Flash bank base address. These offsets are defined in the WRP address registers: [Flash Bank 1 WRP area A address register \(FLASH\\_WRP1AR\)](#), [Flash Bank 1 WRP area B address register \(FLASH\\_WRP1BR\)](#), [Flash Bank 2 WRP area A address register \(FLASH\\_WRP2AR\)](#), [Flash Bank 2 WRP area B address register \(FLASH\\_WRP2BR\)](#).

The Bank “x” WRP “y” area (x=1,2 and y=A,B) is defined from the address: *Bank “x” Base address + [WRPxy\_STRT x 0x800] (included)* to the address: *Bank “x” Base address + [(WRPxy\_END+1) x 0x800] (excluded)*.

For example, to protect by WRP from the address 0x0806 2800 (included) to the address 0x0807 07FF (included):

- if boot in flash is done in Bank 1, FLASH\_WRP1AR register must be programmed with:
  - WRP1A\_STRT = 0xC5.
  - WRP1A\_END = 0xE0.
 WRP1B\_STRT and WRP1B\_END in FLASH\_WRP1BR can be used instead (area “B” in Bank 1).
- If the two banks are swapped, the protection must apply to bank 2, and FLASH\_WRP2AR register must be programmed with:
  - WRP2A\_STRT = 0xC5.
  - WRP2A\_END = 0xE0.
 WRP2B\_STRT and WRP2B\_END in FLASH\_WRP2BR can be used instead (area “B” in Bank 2).

When WRP is active, it cannot be erased or programmed. Consequently, a software mass erase cannot be performed if one area is write-protected.

If an erase/program operation to a write-protected part of the Flash memory is attempted, the write protection error flag (WRPERR) is set in the FLASH\_SR register. This flag is also set for any write access to:

- OTP area
- part of the Flash memory that can never be written like the ICP
- PCROP area.

*Note:* When the memory read protection level is selected (RDP level = 1), it is not possible to program or erase Flash memory if the CPU debug features are connected (JTAG or single wire) or boot code is being executed from RAM or System flash, even if WRP is not activated.

*Note:* To validate the WRP options, the option bytes must be reloaded through the OBL\_LAUNCH bit in Flash control register.

## 3.6 FLASH interrupts

Table 16. Flash interrupt request

| Interrupt event  | Event flag           | Event flag/interrupt clearing method | Interrupt enable control bit |
|------------------|----------------------|--------------------------------------|------------------------------|
| End of operation | EOP <sup>(1)</sup>   | Write EOP=1                          | EOPIE                        |
| Operation error  | OPERR <sup>(2)</sup> | Write OPERR=1                        | ERRIE                        |
| Read error       | RDERR                | Write RDERR=1                        | RDERRIE                      |
| ECC correction   | ECCC                 | Write ECCC=1                         | ECCIE                        |

1. EOP is set only if EOPIE is set.

2. OPERR is set only if ERRIE is set.

## 3.7 FLASH registers

### 3.7.1 Flash access control register (FLASH\_ACR)

Address offset: 0x00

Reset value: 0x0000 0600

Access: no wait state, word, half-word and byte access

| 31   | 30       | 29     | 28    | 27    | 26   | 25   | 24     | 23   | 22   | 21   | 20   | 19   | 18           | 17   | 16   |
|------|----------|--------|-------|-------|------|------|--------|------|------|------|------|------|--------------|------|------|
| Res. | Res.     | Res.   | Res.  | Res.  | Res. | Res. | Res.   | Res. | Res. | Res. | Res. | Res. | Res.         | Res. | Res. |
|      |          |        |       |       |      |      |        |      |      |      |      |      |              |      |      |
| 15   | 14       | 13     | 12    | 11    | 10   | 9    | 8      | 7    | 6    | 5    | 4    | 3    | 2            | 1    | 0    |
| Res. | SLEEP_PD | RUN_PD | DCRST | ICRST | DCEN | ICEN | PRFTEN | Res. | Res. | Res. | Res. | Res. | LATENCY[2:0] |      |      |
|      | rw       | rw     | rw    | rw    | rw   | rw   | rw     |      |      |      |      |      | rw           | rw   | rw   |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **SLEEP\_PD**: Flash Power-down mode during Sleep or Low-power sleep mode

This bit determines whether the flash memory is in Power-down mode or Idle mode when the device is in Sleep or Low-power sleep mode.

0: Flash in Idle mode during Sleep and Low-power sleep modes

1: Flash in Power-down mode during Sleep and Low-power sleep modes

**Caution:** The flash must not be put in power-down while a program or an erase operation is on-going.

Bit 13 **RUN\_PD**: Flash Power-down mode during Run or Low-power run mode

This bit is write-protected with FLASH\_PDKEYR.

This bit determines whether the flash memory is in Power-down mode or Idle mode when the device is in Run or Low-power run mode. The flash memory can be put in power-down mode only when the code is executed from RAM. The Flash must not be accessed when RUN\_PD is set.

0: Flash in Idle mode

1: Flash in Power-down mode

**Caution:** The flash must not be put in power-down while a program or an erase operation is on-going.

Bit 12 **DCRST**: Data cache reset

0: Data cache is not reset

1: Data cache is reset

This bit can be written only when the data cache is disabled.

Bit 11 **ICRST**: Instruction cache reset

0: Instruction cache is not reset

1: Instruction cache is reset

This bit can be written only when the instruction cache is disabled.

Bit 10 **DCEN**: Data cache enable

0: Data cache is disabled

1: Data cache is enabled

Bit 9 **ICEN**: Instruction cache enable  
 0: Instruction cache is disabled  
 1: Instruction cache is enabled

Bit 8 **PRFTEN**: Prefetch enable  
 0: Prefetch disabled  
 1: Prefetch enabled

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **LATENCY[2:0]**: Latency  
 These bits represent the number of HCLK (AHB clock) period to the Flash access time.  
 000: Zero wait state  
 001: One wait state  
 010: Two wait states  
 011: Three wait states  
 100: Four wait states  
 others: Reserved

### 3.7.2 Flash Power-down key register (FLASH\_PDKEYR)

Address offset: 0x04

Reset value: 0x0000 0000

Access: no wait state, word access

|               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| PDKEYR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w             | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| PDKEYR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w             | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **PDKEYR**: Power-down in Run mode Flash key

The following values must be written consecutively to unlock the RUN\_PD bit in FLASH\_ACR:

PDKEY1: 0x0415 2637

PDKEY2: 0xFAFB FCFD

### 3.7.3 Flash key register (FLASH\_KEYR)

Address offset: 0x08

Reset value: 0x0000 0000

Access: no wait state, word access

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| KEYR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w           | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| KEYR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w           | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **KEYR**: Flash key

The following values must be written consecutively to unlock the FLASH\_CR register allowing flash programming/erasing operations:

KEY1: 0x4567 0123

KEY2: 0xCDEF 89AB

### 3.7.4 Flash option key register (FLASH\_OPTKEYR)

Address offset: 0x0C

Reset value: 0x0000 0000

Access: no wait state, word access

|                |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| OPTKEYR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w              | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| OPTKEYR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w              | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **OPTKEYR**: Option byte key

The following values must be written consecutively to unlock the FLASH\_OTPR register allowing option byte programming/erasing operations:

KEY1: 0x0819 2A3B

KEY2: 0x4C5D 6E7F

### 3.7.5 Flash status register (FLASH\_SR)

Address offset: 0x10

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

|             |           |      |      |      |      |             |             |            |            |            |            |             |      |           |       |
|-------------|-----------|------|------|------|------|-------------|-------------|------------|------------|------------|------------|-------------|------|-----------|-------|
| 31          | 30        | 29   | 28   | 27   | 26   | 25          | 24          | 23         | 22         | 21         | 20         | 19          | 18   | 17        | 16    |
| Res.        | Res.      | Res. | Res. | Res. | Res. | Res.        | Res.        | Res.       | Res.       | Res.       | Res.       | Res.        | Res. | Res.      | BSY   |
|             |           |      |      |      |      |             |             |            |            |            |            |             |      |           | r     |
| 15          | 14        | 13   | 12   | 11   | 10   | 9           | 8           | 7          | 6          | 5          | 4          | 3           | 2    | 1         | 0     |
| OPTV<br>ERR | RD<br>ERR | Res. | Res. | Res. | Res. | FAST<br>ERR | MISS<br>ERR | PGS<br>ERR | SIZ<br>ERR | PGA<br>ERR | WRP<br>ERR | PROG<br>ERR | Res. | OP<br>ERR | EOP   |
| rc_w1       | rc_w1     |      |      |      |      | rc_w1       | rc_w1       | rc_w1      | rc_w1      | rc_w1      | rc_w1      | rc_w1       |      | rc_w1     | rc_w1 |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **BSY**: Busy

This indicates that a Flash operation is in progress. This is set on the beginning of a Flash operation and reset when the operation finishes or when an error occurs.

Bit 15 **OPTVERR**: Option validity error

Set by hardware when the options read may not be the one configured by the user. If option haven't been properly loaded, OPTVERR is set again after each system reset.

Cleared by writing 1.

Bit 14 **RDERR**: PCROP read error

Set by hardware when an address to be read through the D-bus belongs to a read protected area of the flash (PCROP protection). An interrupt is generated if RDERRIE is set in FLASH\_CR.

Cleared by writing 1.

Bits 13:10 Reserved, must be kept at reset value.

Bit 9 **FASTERR**: Fast programming error

Set by hardware when a fast programming sequence (activated by FSTPG) is interrupted due to an error (alignment, size, write protection or data miss). The corresponding status bit (PGAERR, SIZERR, WRPERR or MISSERR) is set at the same time.

Cleared by writing 1.

Bit 8 **MISERR**: Fast programming data miss error

In Fast programming mode, 32 double words must be sent to flash successively, and the new data must be sent to the flash logic control before the current data is fully programmed. MISERR is set by hardware when the new data is not present in time.

Cleared by writing 1.

Bit 7 **PGSERR**: Programming sequence error

Set by hardware when a write access to the Flash memory is performed by the code while PG or FSTPG have not been set previously. Set also by hardware when PROGERR, SIZERR, PGAERR, MISSERR or FASTERR is set due to a previous programming error.

Cleared by writing 1.

Bit 6 **SIZERR**: Size error

Set by hardware when the size of the access is a byte or half-word during a program or a fast program sequence. Only double word programming is allowed (consequently: word access).

Cleared by writing 1.

Bit 5 **PGAERR**: Programming alignment error

Set by hardware when the data to program cannot be contained in the same 64-bit Flash memory row in case of standard programming, or if there is a change of page during fast programming.

Cleared by writing 1.

Bit 4 **WRPERR**: Write protection error

Set by hardware when an address to be erased/programmed belongs to a write-protected part (by WRP, PCROP or RDP level 1) of the Flash memory.

Cleared by writing 1.

Bit 3 **PROGERR**: Programming error

Set by hardware when a double-word address to be programmed contains a value different from '0xFFFF FFFF' before programming, except if the data to write is '0x0000 0000'.

Cleared by writing 1.

## Bit 2 Reserved, must be kept at reset value.

Bit 1 **OPERR**: Operation error

Set by hardware when a Flash memory operation (program / erase) completes unsuccessfully.

This bit is set only if error interrupts are enabled (ERRIE = 1).

Cleared by writing '1'.

Bit 0 **EOP**: End of operation

Set by hardware when one or more Flash memory operation (programming / erase) has been completed successfully.

This bit is set only if the end of operation interrupts are enabled (EOPIE = 1).

Cleared by writing 1.

### 3.7.6 Flash control register (FLASH\_CR)

Address offset: 0x14

Reset value: 0xC000 0000

Access: no wait state when no Flash memory operation is on going, word, half-word and byte access

| 31   | 30       | 29   | 28   | 27         | 26       | 25     | 24     | 23   | 22   | 21   | 20   | 19   | 18    | 17       | 16   |
|------|----------|------|------|------------|----------|--------|--------|------|------|------|------|------|-------|----------|------|
| LOCK | OPT LOCK | Res. | Res. | OBL_LAUNCH | RD ERRIE | ERR IE | EOP IE | Res. | Res. | Res. | Res. | Res. | FSTPG | OPT STRT | STRT |
| rs   | rs       |      |      | rc_w1      | rw       | rw     | rw     |      |      |      |      |      | rw    | rs       | rs   |
| 15   | 14       | 13   | 12   | 11         | 10       | 9      | 8      | 7    | 6    | 5    | 4    | 3    | 2     | 1        | 0    |
| MER2 | Res      | Res  | Res  | BKER       | PNB[7:0] |        |        |      |      |      |      |      | MER1  | PER      | PG   |
| rw   |          |      |      | rw         | rw       | rw     | rw     | rw   | rw   | rw   | rw   | rw   | rw    | rw       | rw   |

- Bit 31 **LOCK**: FLASH\_CR Lock  
 This bit is set only. When set, the FLASH\_CR register is locked. It is cleared by hardware after detecting the unlock sequence.  
 In case of an unsuccessful unlock operation, this bit remains set until the next system reset.
- Bit 30 **OPTLOCK**: Options Lock  
 This bit is set only. When set, all bits concerning user option in FLASH\_CR register and so option page are locked. This bit is cleared by hardware after detecting the unlock sequence. The LOCK bit must be cleared before doing the unlock sequence for OPTLOCK bit.  
 In case of an unsuccessful unlock operation, this bit remains set until the next reset.
- Bits 29:28 Reserved, must be kept at reset value.
- Bit 27 **OBL\_LAUNCH**: Force the option byte loading  
 When set to 1, this bit forces the option byte reloading. This bit is cleared only when the option byte loading is complete. It cannot be written if OPTLOCK is set.  
 0: Option byte loading complete  
 1: Option byte loading requested
- Bit 26 **RDERRIE**: PCROP read error interrupt enable  
 This bit enables the interrupt generation when the RDERR bit in the FLASH\_SR is set to 1.  
 0: PCROP read error interrupt disabled  
 1: PCROP read error interrupt enabled
- Bit 25 **ERRIE**: Error interrupt enable  
 This bit enables the interrupt generation when the OPERR bit in the FLASH\_SR is set to 1.  
 0: OPERR error interrupt disabled  
 1: OPERR error interrupt enabled
- Bit 24 **EOPIE**: End of operation interrupt enable  
 This bit enables the interrupt generation when the EOP bit in the FLASH\_SR is set to 1.  
 0: EOP Interrupt disabled  
 1: EOP Interrupt enabled
- Bits 23:19 Reserved, must be kept at reset value
- Bit 18 **FSTPG**: Fast programming  
 0: Fast programming disabled  
 1: Fast programming enabled
- Bit 17 **OPTSTRT**: Options modification start  
 This bit triggers an options operation when set.  
 This bit is set only by software, and is cleared when the BSY bit is cleared in FLASH\_SR.
- Bit 16 **STRT**: Start  
 This bit triggers an erase operation when set. If MER1, MER2 and PER bits are reset and the STRT bit is set, an unpredictable behavior may occur without generating any error flag. This condition should be forbidden.  
 This bit is set only by software, and is cleared when the BSY bit is cleared in FLASH\_SR.

Bit 15 **MER2**: Bank 2 Mass erase

This bit triggers the bank 2 mass erase (all bank 2 user pages) when set.

Bits 14:12 Reserved, must be kept at reset value.

Bit 11 **BKER**: Page number MSB (Bank selection)

0: Bank 1 is selected for page erase

1: Bank 2 is selected for page erase

Bits 10:3 **PNB[7:0]**: Page number selection

These bits select the page to erase:

If BKER = 0:

00000000: page 0

00000001: page 1

...

11111111: page 255

If BKER=1

00000000: page 256

00000001: page 257

...

11111111: page 511

Bit 2 **MER1**: Bank 1 Mass erase

This bit triggers the bank 1 mass erase (all bank 1 user pages) when set.

Bit 1 **PER**: Page erase

0: page erase disabled

1: page erase enabled

Bit 0 **PG**: Programming

0: Flash programming disabled

1: Flash programming enabled

### 3.7.7 Flash ECC register (FLASH\_ECCR)

Address offset: 0x18

Reset value: 0x0000 0000

Access: no wait state when no Flash memory operation is on going, word, half-word and byte access

|                |       |      |      |      |      |      |            |      |      |      |              |            |                 |    |    |

| ADDR_ECC[15:0] |       |      |      |      |      |      |            |      |      |      |              |            |                 |    |    |
| r              | r     | r    | r    | r    | r    | r    | r          | r    | r    | r    | r            | r          | r               | r  | r  |

Bit 31 **ECCD**: ECC detection

Set by hardware when two ECC errors have been detected. When this bit is set, a NMI is generated  
Cleared by writing 1.

Bit 30 **ECCC**: ECC correction

Set by hardware when one ECC error has been detected and corrected. An interrupt is generated if ECCIE is set.  
Cleared by writing 1.

Bits 29:25 Reserved, must be kept at reset value.

Bit 24 **ECCIE**: ECC correction interrupt enable

0: ECCC interrupt disabled  
1: ECCC interrupt enabled.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **SYSF\_ECC**: System Flash ECC fail

This bit indicates that the ECC error correction or double ECC error detection is located in the System Flash.

Bit 19 **BK\_ECC**: ECC fail bank

This bit indicates which bank is concerned by the ECC error correction or by the double ECC error detection.  
0: bank 1  
1: bank 2

Bits 18:0 **ADDR\_ECC**: ECC fail address

This bit indicates which address in the bank is concerned by the ECC error correction or by the double ECC error detection.

### 3.7.8 Flash option register (FLASH\_OPTR)

Address offset: 0x20

Reset value: 0xFFFF XXXX. Register bits 0 to 31 are loaded with values from Flash memory at OBL.

Access: no wait state when no Flash memory operation is on going; word, half-word and byte access

| 31   | 30            | 29             | 28            | 27         | 26           | 25            | 24           | 23         | 22   | 21           | 20   | 19          | 18             | 17            | 16          |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **nBOOT0**: nBOOT0 option bit (this bit is reserved for STM32L47x/L48x devices)  
 0: nBOOT0 = 0  
 1: nBOOT0 = 1

Bit 26 **nSWBOOT0**: Software BOOT0 (this bit is reserved for STM32L47x/L48x devices)  
 0: BOOT0 taken from the option bit nBOOT0  
 1: BOOT0 taken from PH3/BOOT0 pin

Bit 25 **SRAM2\_RST**: SRAM2 Erase when system reset  
 0: SRAM2 erased when a system reset occurs  
 1: SRAM2 is not erased when a system reset occurs

Bit 24 **SRAM2\_PE**: SRAM2 parity check enable  
 0: SRAM2 parity check enable  
 1: SRAM2 parity check disable

Bit 23 **nBOOT1**: Boot configuration  
 Together with the BOOT0 pin, this bit selects boot mode from the Flash main memory, SRAM1 or the System memory. Refer to [Section 2.6: Boot configuration](#).

Bit 22 Reserved, must be kept at reset value.

Bit 21 **DUALBANK**: Dual-Bank on 512 KB or 256 KB Flash memory devices  
 0: 256 KB/512 KB Single-bank Flash: Contiguous addresses in Bank 1  
 1: 256 KB/512 KB Dual-bank Flash: Refer to [Table 9](#) and [Table 10](#).

Bit 20 **BFB2**: Dual-bank boot  
 0: Dual-bank boot disable  
 1: Dual-bank boot enable

Bit 19 **WWDG\_SW**: Window watchdog selection  
 0: Hardware window watchdog  
 1: Software window watchdog

Bit 18 **IWDG\_STDBY**: Independent watchdog counter freeze in Standby mode  
 0: Independent watchdog counter is frozen in Standby mode  
 1: Independent watchdog counter is running in Standby mode

Bit 17 **IWDG\_STOP**: Independent watchdog counter freeze in Stop mode  
 0: Independent watchdog counter is frozen in Stop mode  
 1: Independent watchdog counter is running in Stop mode

Bit 16 **IDWG\_SW**: Independent watchdog selection  
 0: Hardware independent watchdog  
 1: Software independent watchdog

Bit 15 Reserved, must be kept at reset value

Bit 14 **nRST\_SHDW**  
 0: Reset generated when entering the Shutdown mode  
 1: No reset generated when entering the Shutdown mode

Bit 13 **nRST\_STDBY**  
 0: Reset generated when entering the Standby mode  
 1: No reset generate when entering the Standby mode

Bit 12 **nRST\_STOP**

- 0: Reset generated when entering the Stop mode
- 1: No reset generated when entering the Stop mode

Bit 11 Reserved, must be kept at reset value

Bits10:8 **BOR\_LEV**: BOR reset Level

These bits contain the VDD supply level threshold that activates/releases the reset.

- 000: BOR Level 0. Reset level threshold is around 1.7 V
- 001: BOR Level 1. Reset level threshold is around 2.0 V
- 010: BOR Level 2. Reset level threshold is around 2.2 V
- 011: BOR Level 3. Reset level threshold is around 2.5 V
- 100: BOR Level 4. Reset level threshold is around 2.8 V

Bits 7:0 **RDP**: Read protection level

- 0xAA: Level 0, read protection not active
- 0xCC: Level 2, chip read protection active
- Others: Level 1, memories read protection active

*Note: Take care about PCROP\_RDP configuration in Level 1. Refer to [Section : Level 1: Read protection](#) for more details.*

### 3.7.9 Flash Bank 1 PCROP Start address register (FLASH\_PCROP1SR)

Address offset: 0x24

Reset value: 0xFFFF XXXX. Register bits are loaded with values from Flash memory at OBL. Reserved bits are read as “1”.

Access: no wait state when no Flash memory operation is on going; word, half-word access.

|                   |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value

Bits 15:0 **PCROP1\_STRT**: Bank 1 PCROP area start offset

PCROP1\_STRT contains the first double-word of the PCROP area.

### 3.7.10 Flash Bank 1 PCROP End address register (FLASH\_PCROP1ER)

Address offset: 0x28

Reset value: 0xFFFF XXXX. Register bits are loaded with values from Flash memory at OBL. Reserved bits are read as “1”.

Access: no wait state when no Flash memory operation is on going; word, half-word access. PCROP\_RDP bit can be accessed with byte access.

|                  |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bit 31 **PCROP\_RDP**: PCROP area preserved when RDP level decreased

This bit is set only. It is reset after a full mass erase due to a change of RDP from Level 1 to Level 0.

0: PCROP area is not erased when the RDP level is decreased from Level 1 to Level 0.

1: PCROP area is erased when the RDP level is decreased from Level 1 to Level 0 (full mass erase).

Bits 30:16 Reserved, must be kept at reset value

Bits 15:0 **PCROP1\_END**: Bank 1 PCROP area end offset

PCROP1\_END contains the last double-word of the bank 1 PCROP area.

### 3.7.11 Flash Bank 1 WRP area A address register (FLASH\_WRP1AR)

Address offset: 0x2C

Reset value: 0xFFXX FFXX. Register bits are loaded with values from Flash memory at OBL. Reserved bits are read as “1”.

Access: no wait state when no Flash memory operation is on going; word, half-word and byte access

|      |      |      |      |      |      |      |      |                 |    |    |    |    |    |    |    |

Bits 31:24 Reserved, must be kept at reset value

Bits 23:16 **WRP1A\_END**: Bank 1 WRP first area “A” end offset

WRP1A\_END contains the last page of the Bank 1 WRP first area.

Bits 15:8 Reserved, must be kept at reset value

Bits 7:0 **WRP1A\_STRT**: Bank 1 WRP first area “A” start offset

WRP1A\_STRT contains the first page of the Bank 1 WRP first area.

### 3.7.12 Flash Bank 1 WRP area B address register (FLASH\_WRP1BR)

Address offset: 0x30

Reset value: 0xFFXX FFXX. Register bits are loaded with values from Flash memory at OBL. Reserved bits are read at “1”.

Access: no wait state when no Flash memory operation is on going; word, half-word and byte access

|      |      |      |      |      |      |      |      |                 |    |    |    |    |    |    |    |
|------|------|------|------|------|------|------|------|-----------------|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23              | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:24 Reserved, must be kept at reset value

Bits 23:16 **WRP1B\_END**: Bank 1 WRP second area “B” end offset

WRP1B\_END contains the last page of the Bank 1 WRP second area.

Bits 15:8 Reserved, must be kept at reset value

Bits 7:0 **WRP1B\_STRT**: Bank 1 WRP second area “B” start offset

WRP1B\_STRT contains the first page of the Bank 1 WRP second area.

### 3.7.13 Flash Bank 2 PCROP Start address register (FLASH\_PCROP2SR)

Address offset: 0x44

Reset value: 0xFFFF XXXX

Access: no wait state when no Flash memory operation is on going; word, half-word access.

|                   |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

| 15                | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| PCROP2_STRT[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rW                | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   |

Bits 31:16 Reserved, must be kept at reset value

Bits 15:0 **PCROP2\_STRT**: Bank 2 PCROP area start offset

PCROP2\_STRT contains the first double-word of the Bank 2 PCROP area.

### 3.7.14 Flash Bank 2 PCROP End address register (FLASH\_PCROP2ER)

Address offset: 0x48

Reset value: 0xFFFF XXXX

Access: no wait state when no Flash memory operation is on going; word, half-word access

|                  |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31               | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.             | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|                  |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

| PCROP2_END[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rw               | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value

Bits 15:0 **PCROP2\_END**: Bank 2 PCROP area end offset

PCROP2\_END contains the last double-word of the bank 2 PCROP area.

### 3.7.15 Flash Bank 2 WRP area A address register (FLASH\_WRP2AR)

Address offset: 0x4C

Reset value: 0xFFXX FFXX

Access: no wait state when no Flash memory operation is on going; word, half-word and byte access

|      |      |      |      |      |      |      |      |                 |    |    |    |    |    |    |    |

Bits 31:24 Reserved, must be kept at reset value

Bits 23:16 **WRP2A\_END**: Bank 2 WRP first area "A" end offset

WRP2A\_END contains the last page of the bank 2 WRP first area.

Bits 15:8 Reserved, must be kept at reset value

Bits 7:0 **WRP2A\_STRT**: Bank 2 WRP first area "A" start offset

WRP2A\_STRT contains the first page of the bank 2 WRP first area.

### 3.7.16 Flash Bank 2 WRP area B address register (FLASH\_WRP2BR)

Address offset: 0x50

Reset value: 0xFFXX FFXX

Access: no wait state when no Flash memory operation is on going; word, half-word and byte access

|      |      |      |      |      |      |      |      |                 |    |    |    |    |    |    |    |

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 4 Firewall (FW)

### 4.1 Introduction

The Firewall is made to protect a specific part of code or data into the Non-Volatile Memory, and/or to protect the Volatile data into the SRAM1 from the rest of the code executed outside the protected area.

### 4.2 Firewall main features

- The code to protect by the Firewall (Code Segment) may be located in:
  - The Flash memory map
  - The SRAM1 memory, if declared as an executable protected area during the Firewall configuration step.
- The data to protect can be located either
  - in the Flash memory (non-volatile data segment)
  - in the SRAM1 memory (volatile data segment)

The software can access these protected areas once the Firewall is opened. The Firewall can be opened or closed using a mechanism based on “call gate” (Refer to [Opening the Firewall](#)).

The start address of each segment and its respective length must be configured before enabling the Firewall (Refer to [Section 4.3.5: Firewall initialization](#)).

Each illegal access into these protected segments (if the Firewall is enabled) generates a reset which immediately kills the detected intrusion.

Any DMA access to protected segments is forbidden whatever the Firewall state (opened or closed). It is considered as an illegal access and generates a reset.

## 4.3 Firewall functional description

### 4.3.1 Firewall AMBA bus snoop

The Firewall peripheral is snooping the AMBA buses on which the memories (volatile and non-volatile) are connected. A global architecture view is illustrated in [Figure 7](#).

**Figure 7. STM32L47x/L48x/L49x/L4Ax firewall connection schematics**

### 4.3.2 Functional requirements

There are several requirements to guaranty the highest security level by the application code/data which needs to be protected by the Firewall and to avoid unwanted Firewall alarm (reset generation).

#### Debug consideration

In debug mode, if the Firewall is opened, the accesses by the debugger to the protected segments are not blocked. For this reason, the Read out level 2 protection must be active in conjunction with the Firewall implementation.

If the debug is needed, it is possible to proceed in the following way:

- A dummy code having the same API as the protected code may be developed during the development phase of the final user code. This dummy code may send back coherent answers (in terms of function and potentially timing if needed), as the protected code should do in production phase.
- In the development phase, the protected code can be given to the customer-end under NDA agreement and its software can be developed in level 0 protection. The customer-

end code needs to embed an IAP located in a write protected segment in order to allow future code updates when the production parts will be Level 2 ROP.

### Write protection

In order to offer a maximum security level, the following points need to be respected:

- It is mandatory to keep a write protection on the part of the code enabling the Firewall. This activation code should be located outside the segments protected by the Firewall.
- The write protection is also mandatory on the code segment protected by the Firewall.
- The page including the reset vector must be write-protected.

### Interrupts management

The code protected by the Firewall must not be interruptible. It is up to the user code to disable any interrupt source before executing the code protected by the Firewall. If this constraint is not respected, if an interrupt comes while the protected code is executed (Firewall opened), the Firewall will be closed as soon as the interrupt subroutine is executed. When the code returns back to the protected code area, a Firewall alarm will raise since the “call gate” sequence will not be applied and a reset will be generated.

Concerning the interrupt vectors and the first user page in the Flash memory:

- If the first user page (including the reset vector) is protected by the Firewall, the NVIC vector should be reprogrammed outside the protected segment.
- If the first user page is not protected by the Firewall, the interrupt vectors may be kept at this location.

There is no interrupt generated by the Firewall.

## 4.3.3 Firewall segments

The Firewall has been designed to protect three different segment areas:

### Code segment

This segment is located into the Flash memory. It should contain the code to execute which requires the Firewall protection. The segment must be reached using the “call gate” entry sequence to open the Firewall. A system reset is generated if the “call gate” entry sequence is not respected (refer to [Opening the Firewall](#)) and if the Firewall is enabled using the FWDIS bit in the system configuration register. The length of the segment and the segment base address must be configured before enabling the Firewall (refer to [Section 4.3.5: Firewall initialization](#)).

### Non-volatile data segment

This segment contains non-volatile data used by the protected code which must be protected by the Firewall. The access to this segment is defined into [Section 4.3.4: Segment accesses and properties](#). The Firewall must be opened before accessing the data in this area. The Non-Volatile data segment should be located into the Flash memory. The segment length and the base address of the segment must be configured before enabling the Firewall (refer to [Section 4.3.5: Firewall initialization](#)).

### Volatile data segment

Volatile data used by the protected code located into the code segment must be defined into the SRAM1 memory. The access to this segment is defined into the [Section 4.3.4: Segment accesses and properties](#). Depending on the Volatile data segment configuration, the Firewall must be opened or not before accessing this segment area. The segment length and the base address of the segment as well as the segment options must be configured before enabling the Firewall (refer to [Section 4.3.5: Firewall initialization](#)).

The Volatile data segment can also be defined as executable (for the code execution) or shared using two bit of the Firewall configuration register (bit VDS for the volatile data sharing option and bit VDE for the volatile data execution capability). For more details, refer to [Table 18](#).

## 4.3.4 Segment accesses and properties

All DMA accesses to the protected segments are forbidden, whatever the Firewall state, and generate a system reset.

### Segment access depending on the Firewall state

Each of the three segments has specific properties which are presented in [Table 18](#).

**Table 18. Segment accesses according to the Firewall state**

| Segment                   | Firewall opened<br>access allowed                                                         | Firewall closed<br>access allowed                                                                                                                                                                                                                          | Firewall disabled<br>access allowed                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Code segment              | Read and execute                                                                          | No access allowed.<br>Any access to the segment (except the "call gate" entry) generates a system reset                                                                                                                                                    | All accesses are allowed (according to the Flash page protection properties in which the code is located) |
| Non-volatile data segment | Read and write                                                                            | No access allowed                                                                                                                                                                                                                                          | All accesses are allowed (according to the Flash page protection properties in which the code is located) |
| Volatile data segment     | Read and Write<br>Execute if VDE = 1 and VDS = 0 into the Firewall configuration register | No access allowed if VDS = 0 and VDE = 0 into the Firewall configuration register<br>Read/write/execute accesses allowed if VDS = 1 (whatever VDE bit value)<br>Execute if VDE = 1 and VDS = 0 but with a "call gate" entry to open the Firewall at first. | All accesses are allowed                                                                                  |

The Volatile data segment is a bit different from the two others. The segment can be:

- **Shared (VDS bit in the register)**  
It means that the area and the data located into this segment can be shared between the protected code and the user code executed in a non-protected area. The access is allowed whether the Firewall is opened or closed or disabled.  
The VDS bit gets priority over the VDE bit, this last bit value being ignored in such a case. It means that the Volatile data segment can execute parts of code located there without any need to open the Firewall before executing the code.
- **Execute**  
The VDE bit is considered as soon as the VDS bit = 0 in the FW\_CR register. If the VDS bit = 1, refer to the description above on the Volatile data segment sharing. If VDS = 0 and VDE = 1, the Volatile data segment is executable. To avoid a system reset generation from the Firewall, the “call gate” sequence should be applied on the Volatile data segment to open the Firewall as an entry point for the code execution.

### Segments properties

Each segment has a specific length register to define the segment size to be protected by the Firewall: CSL register for the Code segment length register, NVDSL for the Non-volatile data segment length register, and VDSL register for the Volatile data segment length register. Granularity and area ranges for each of the segments are presented in [Table 19](#).

**Table 19. Segment granularity and area ranges**

| Segment                   | Granularity | Area range                                                                                            |
|---------------------------|-------------|-------------------------------------------------------------------------------------------------------|
| Code segment              | 256 byte    | 1024 Kbytes - 256 bytes                                                                               |
| Non-volatile data segment | 256 byte    | 1024 Kbytes - 256 bytes                                                                               |
| Volatile data segment     | 64 byte     | 256 Kbytes - 64 bytes (on STM32L49x/L4Ax devices)<br>96 Kbytes - 64 bytes (on STM32L47x/L48x devices) |

### 4.3.5 Firewall initialization

The initialization phase should take place at the beginning of the user code execution (refer to the [Write protection](#)).

The initialization phase consists of setting up the addresses and the lengths of each segment which needs to be protected by the Firewall. It must be done before enabling the Firewall, because the enabling bit can be written once. Thus, when the Firewall is enabled, it cannot be disabled anymore until the next system reset.

Once the Firewall is enabled, the accesses to the address and length segments are no longer possible. All write attempts are discarded.

A segment defined with a length equal to 0 is not considered as protected by the Firewall. As a consequence, there is no reset generation from the Firewall when an access to the base address of this segment is performed.

After a reset, the Firewall is disabled by default (FWDIS bit in the SYSCFG register is set). It has to be cleared to enable the Firewall feature.

Below is the initialization procedure to follow:

1. Configure the RCC to enable the clock to the Firewall module
2. Configure the RCC to enable the clock of the system configuration registers
3. Set the base address and length of each segment (CSSA, CSL, NVDSSA, NVDSL, VDSSA, VDSL registers)
4. Set the configuration register of the Firewall (FW\_CR register)
5. Enable the Firewall clearing the FWDIS bit in the system configuration register.

The Firewall configuration register (FW\_CR register) is the only one which can be managed in a dynamic way even if the Firewall is enabled:

- when the Non-Volatile data segment is undefined (meaning the NVDSL register is equal to 0), the accesses to this register are possible whatever the Firewall state (opened or closed).
- when the Non-Volatile data segment is defined (meaning the NVDSL register is different from 0), the accesses to this register are only possible when the Firewall is opened.

### 4.3.6 Firewall states

The Firewall has three different states as shown in [Figure 8](#):

- Disabled: The FWDIS bit is set by default after the reset. The Firewall is not active.
- Closed: The Firewall protects the accesses to the three segments (Code, Non-volatile data, and Volatile data segments).
- Opened: The Firewall allows access to the protected segments as defined in [Section 4.3.4: Segment accesses and properties](#).

**Figure 8. Firewall functional states**

## Opening the Firewall

As soon as the Firewall is enabled, it is closed. It means that most of the accesses to the protected segments are forbidden (refer to [Section 4.3.4: Segment accesses and properties](#)). In order to open the Firewall to interact with the protected segments, it is mandatory to apply the “call gate” sequence described hereafter.

### “call gate” sequence

The “call gate” is composed of 3 words located on the first three 32-bit addresses of the base address of the code segment and of the Volatile data segment if it is declared as not shared (VDS = 0) and executable (VDE = 1).

- 1st word: Dummy 32-bit words always closed in order to protect the “call gate” opening from an access due to a prefetch buffer.
- 2nd and 3rd words: 2 specific 32-bit words called “call gate” and always opened.

To open the Firewall, the code currently executed must jump to the 2<sup>nd</sup> word of the “call gate” and execute the code from this point. The 2nd word and 3rd word execution must not be interrupted by any intermediate instruction fetch; otherwise, the Firewall is not considered open and comes back to a close state. Then, executing the 3<sup>rd</sup> word after receiving the intermediate instruction fetch would generate a system reset as a consequence.

As soon as the Firewall is opened, the protected segments can be accessed as described in [Section 4.3.4: Segment accesses and properties](#).

## Closing the Firewall

The Firewall is closed immediately after it is enabled (clearing the FWDIS bit in the system configuration register).

To close the Firewall, the protected code must:

- Write the correct value in the Firewall Pre Arm Flag into the FW\_CR register.
- Jump to any executable location outside the Firewall segments.

If the Firewall Pre Arm Flag is not set when the protected code jumps to a non protected segment, a reset is generated. This control bit is an additional protection to avoid an undesired attempt to close the Firewall with the private information not yet cleaned (see the note below).

*For security reasons, following the application for which the Firewall is used, it is advised to clean all private information from CPU registers and hardware cells.*

## 4.4 Firewall registers

### 4.4.1 Code segment start address (FW\_CSSA)

Address offset: 0x00

Reset value: 0x0000 0000

|           |      |      |      |      |      |      |      |            |      |      |      |      |      |      |      |
|-----------|------|------|------|------|------|------|------|------------|------|------|------|------|------|------|------|
| 31        | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23         | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.      | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ADD[23:16] |      |      |      |      |      |      |      |
|           |      |      |      |      |      |      |      | rw         |      |      |      |      |      |      |      |
| 15        | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7          | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| ADD[15:8] |      |      |      |      |      |      |      | Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw        |      |      |      |      |      |      |      |            |      |      |      |      |      |      |      |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:8 **ADD[23:8]**: code segment start address

The LSB bits of the start address (bit 7:0) are reserved and forced to 0 in order to allow a 256-byte granularity.

*Note: These bits can be written only before enabling the Firewall. Refer to [Section 4.3.5: Firewall initialization](#).*

Bits 7:0 Reserved, must be kept at the reset value.

### 4.4.2 Code segment length (FW\_CSL)

Address offset: 0x04

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |      |      |             |      |      |      |      |      |
|------------|------|------|------|------|------|------|------|------|------|-------------|------|------|------|------|------|
| 31         | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21          | 20   | 19   | 18   | 17   | 16   |
| Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LENG[21:16] |      |      |      |      |      |
|            |      |      |      |      |      |      |      |      |      | rw          |      |      |      |      |      |
| 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5           | 4    | 3    | 2    | 1    | 0    |
| LENG[15:8] |      |      |      |      |      |      |      | Res. | Res. | Res.        | Res. | Res. | Res. | Res. | Res. |
| rw         |      |      |      |      |      |      |      |      |      |             |      |      |      |      |      |

Bits 31:22 Reserved, must be kept at the reset value.

Bits 21:8 **LENG[21:8]**: code segment length

LENG[21:8] selects the size of the code segment expressed in bytes but is a multiple of 256 bytes.

The segment area is defined from {ADD[23:8], 0x00} to {ADD[23:8]+LENG[21:8], 0x00} - 0x01

*Note: If LENG[21:8] = 0 after enabling the Firewall, this segment is not defined, thus not protected by the Firewall.*

*These bits can only be written before enabling the Firewall. Refer to [Section 4.3.5: Firewall initialization](#).*

Bits 7:0 Reserved, must be kept at the reset value.

### 4.4.3 Non-volatile data segment start address (FW\_NVDSSA)

Address offset: 0x08

Reset value: 0x0000 0000

|           |      |      |      |      |      |      |      |            |      |      |      |      |      |      |      |
|-----------|------|------|------|------|------|------|------|------------|------|------|------|------|------|------|------|
| 31        | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23         | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.      | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ADD[23:16] |      |      |      |      |      |      |      |
|           |      |      |      |      |      |      |      | rw         |      |      |      |      |      |      |      |
| 15        | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7          | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| ADD[15:8] |      |      |      |      |      |      |      | Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw        |      |      |      |      |      |      |      |            |      |      |      |      |      |      |      |

Bits 31:24 Reserved, must be kept at the reset value.

Bits 23:8 **ADD[23:8]**: Non-volatile data segment start address

The LSB bits of the start address (bit 7:0) are reserved and forced to 0 in order to allow a 256-byte granularity.

*Note: These bits can only be written before enabling the Firewall. Refer to [Section 4.3.5: Firewall initialization](#).*

Bits 7:0 Reserved, must be kept at the reset value.

### 4.4.4 Non-volatile data segment length (FW\_NVDSL)

Address offset: 0x0C

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |      |      |             |      |      |      |      |      |
|------------|------|------|------|------|------|------|------|------|------|-------------|------|------|------|------|------|
| 31         | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21          | 20   | 19   | 18   | 17   | 16   |
| Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LENG[21:16] |      |      |      |      |      |
|            |      |      |      |      |      |      |      |      |      | rw          |      |      |      |      |      |
| 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5           | 4    | 3    | 2    | 1    | 0    |
| LENG[15:8] |      |      |      |      |      |      |      | Res. | Res. | Res.        | Res. | Res. | Res. | Res. | Res. |
| rw         |      |      |      |      |      |      |      |      |      |             |      |      |      |      |      |

Bits 31:22 Reserved, must be kept at the reset value.

Bits 21:8 **LENG[21:8]**: Non-volatile data segment length

LENG[21:8] selects the size of the Non-volatile data segment expressed in bytes but is a multiple of 256 bytes.

The segment area is defined from {ADD[23:8], 0x00} to {ADD[23:8]+LENG[21:8], 0x00} - 0x01

*Note: If LENG[21:8] = 0 after enabling the Firewall, this segment is not defined, thus not protected by the Firewall.*

*These bits can only be written before enabling the Firewall. Refer to [Section 4.3.5: Firewall initialization](#).*

Bits 7:0 Reserved, must be kept at the reset value.

#### 4.4.5 Volatile data segment start address (FW\_VDSSA)

Address offset: 0x10

Reset value: 0x0000 0000

|           |      |      |      |      |      |      |      |      |      |      |      |      |      |             |      |
|-----------|------|------|------|------|------|------|------|------|------|------|------|------|------|-------------|------|
| 31        | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17          | 16   |
| Res.      | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ADD [17:16] |      |
|           |      |      |      |      |      |      |      |      |      |      |      |      |      | rw          | rw   |
| 15        | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1           | 0    |
| ADD[15:6] |      |      |      |      |      |      |      |      |      | Res. | Res. | Res. | Res. | Res.        | Res. |
| rw        |      |      |      |      |      |      |      |      |      |      |      |      |      |             |      |

Bits 31:18 Reserved, must be kept at the reset value.

Bit 17 **ADD[17]**: Volatile data segment start address (this bit is reserved for STM32L47x/L48x devices)

Bits 16:6 **ADD[16:6]**: Volatile data segment start address

The LSB bits of the start address (bit 5:0) are reserved and forced to 0 in order to allow a 64-byte granularity.

*Note: These bits can only be written before enabling the Firewall. Refer to [Section 4.3.5: Firewall initialization](#)*

Bits 5:0 Reserved, must be kept at the reset value.

#### 4.4.6 Volatile data segment length (FW\_VDSL)

Address offset: 0x14

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |      |      |      |      |      |      |              |      |
|------------|------|------|------|------|------|------|------|------|------|------|------|------|------|--------------|------|
| 31         | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17           | 16   |
| Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LENG [17:16] |      |
|            |      |      |      |      |      |      |      |      |      |      |      |      |      | rw           | rw   |
| 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1            | 0    |
| LENG[15:6] |      |      |      |      |      |      |      |      |      | Res. | Res. | Res. | Res. | Res.         | Res. |
| rw         |      |      |      |      |      |      |      |      |      |      |      |      |      |              |      |

Bits 31:18 Reserved, must be kept at the reset value.

Bit 17 **LENG[17]**: volatile data segment length (this bit is reserved for STM32L47x/L48x devices)

Bits 16:6 **LENG[16:6]**: volatile data segment length

LENG[16:6] selects the size of the volatile data segment expressed in bytes but is a multiple of 64 bytes.

The segment area is defined from {ADD[16:6],0x00} to {ADD[16:6]+LENG[16:6], 0x00} - 0x01

*Note: If LENG[17:6] = 0 after enabling the Firewall, this segment is not defined, thus not protected by the Firewall.*

*These bits can only be written before enabling the Firewall. Refer to [Section 4.3.5: Firewall initialization](#).*

Bits 5:0 Reserved, must be kept at the reset value.

4.4.7 Configuration register (FW\_CR)

Address offset: 0x20

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VDE  | VDS  | FPA  |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw   | rw   | rw   |

Bits 31:3 Reserved, must be kept at the reset value.

Bit 2 **VDE**: Volatile data execution

0: Volatile data segment cannot be executed if VDS = 0

1: Volatile data segment is declared executable whatever VDS bit value

When VDS = 1, this bit has no meaning. The Volatile data segment can be executed whatever the VDE bit value.

If VDS = 1, the code can be executed whatever the Firewall state (opened or closed)

If VDS = 0, the code can only be executed if the Firewall is opened or applying the “call gate” entry sequence if the Firewall is closed.

Refer to [Segment access depending on the Firewall state](#).

Bit 1 **VDS**: Volatile data shared

0: Volatile data segment is not shared and cannot be hit by a non protected executable code when the Firewall is closed. If it is accessed in such a condition, a system reset will be generated by the Firewall.

1: Volatile data segment is shared with non protected application code. It can be accessed whatever the Firewall state (opened or closed).

Refer to [Segment access depending on the Firewall state](#).

Bit 0 **FPA**: Firewall prearm

0: any code executed outside the protected segment when the Firewall is opened will generate a system reset.

1: any code executed outside the protected segment will close the Firewall.

Refer to [Closing the Firewall](#).

This register is protected in the same way as the Non-volatile data segment (refer to [Section 4.3.5: Firewall initialization](#)).

### 4.4.8 Firewall register map

The table below provides the Firewall register map and reset values.

**Table 20. Firewall register map and reset values**

| Offset | Register    | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |      |
|--------|-------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 0x0    | FW_CSSA     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ADD  |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | Res. | Res. | Res. | Res. | Res. | Res. | Res. |      |      |

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 5 Power control (PWR)

### 5.1 Power supplies

The STM32L47x/L48x/L49x/L4Ax devices require a 1.71 V to 3.6 V operating supply voltage ( $V_{DD}$ ). Several peripherals are supplied through independent power domains:  $V_{DDA}$ ,  $V_{DDIO2}$ ,  $V_{DDUSB}$ ,  $V_{LCD}$ . Those supplies must not be provided without a valid operating supply on the  $V_{DD}$  pin.

- $V_{DD} = 1.71 \text{ V to } 3.6 \text{ V}$   
 $V_{DD}$  is the external power supply for the I/Os, the internal regulator and the system analog such as reset, power management and internal clocks. It is provided externally through VDD pins.
- $V_{DD12} = 1.05 \text{ V to } 1.32 \text{ V}$   
 External power supply, connected to  $V_{CORE}$ , bypassing internal regulator when connected to an external SMPS. It is provided externally through VDD12 pins and only available on packages with the external SMPS supply option.
- $V_{DDA} = 1.62 \text{ V (ADCs/COMPs) / } 1.8 \text{ V (DACs/OPAMPs) / } 2.4 \text{ V (VREFBUF) to } 3.6 \text{ V}$   
 $V_{DDA}$  is the external analog power supply for A/D converters, D/A converters, voltage reference buffer, operational amplifiers and comparators. The  $V_{DDA}$  voltage level is independent from the  $V_{DD}$  voltage.  $V_{DDA}$  should be preferably connected to  $V_{DD}$  when these peripherals are not used.
- $V_{DDUSB} = 3.0 \text{ V to } 3.6 \text{ V}$   
 $V_{DDUSB}$  is the external independent power supply for USB transceivers. The  $V_{DDUSB}$  voltage level is independent from the  $V_{DD}$  voltage.  $V_{DDUSB}$  should be preferably connected to  $V_{DD}$  when the USB is not used.
- $V_{DDIO2} = 1.08 \text{ V to } 3.6 \text{ V}$   
 $V_{DDIO2}$  is the external power supply for 14 I/Os (Port G[15:2]). The  $V_{DDIO2}$  voltage level is independent from the  $V_{DD}$  voltage and should preferably be connected to  $V_{DD}$  when PG[15:2] are not used.
- $V_{LCD} = 2.5 \text{ V to } 3.6 \text{ V}$   
 The LCD controller can be powered either externally through VLCD pin, or internally from an internal voltage generated by the embedded step-up converter. VLCD is multiplexed with PC3 which can be used as GPIO when the LCD is not used.
- $V_{BAT} = 1.55 \text{ V to } 3.6 \text{ V}$   
 $V_{BAT}$  is the power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when  $V_{DD}$  is not present. VBAT is internally bonded to VDD for small packages without dedicated pin.
- $V_{REF-}$ ,  $V_{REF+}$   
 $V_{REF+}$  is the input reference voltage for ADCs and DACs. It is also the output of the internal voltage reference buffer when enabled.  
 When  $V_{DDA} < 2 \text{ V}$ ,  $V_{REF+}$  must be equal to  $V_{DDA}$ .  
 When  $V_{DDA} \geq 2 \text{ V}$ ,  $V_{REF+}$  must be between 2 V and  $V_{DDA}$ .  
 $V_{REF+}$  can be grounded when ADC and DAC are not active.  
 The internal voltage reference buffer supports two output voltages, which are configured with VRS bit in the VREFBUF\_CSR register:
  - $V_{REF+}$  around 2.048 V. This requires  $V_{DDA}$  equal to or higher than 2.4 V.

- $V_{REF+}$  around 2.5 V. This requires  $V_{DDA}$  equal to or higher than 2.8 V.

$V_{REF-}$  and  $V_{REF+}$  pins are not available on all packages. When not available on the package, they are bonded to  $V_{SSA}$  and  $V_{DDA}$ , respectively.

When the  $V_{REF+}$  is double-bonded with  $V_{DDA}$  in a package, the internal voltage reference buffer is not available and must be kept disable (refer to related device datasheet for packages pinout description).

$V_{REF-}$  must always be equal to  $V_{SSA}$ .

An embedded linear voltage regulator is used to supply the internal digital power  $V_{CORE}$ .  $V_{CORE}$  is the power supply for digital peripherals and memories.

**Figure 9. Power supply overview**

### 5.1.1 Independent analog peripherals supply

To improve ADC and DAC conversion accuracy and to extend the supply flexibility, the analog peripherals have an independent power supply which can be separately filtered and shielded from noise on the PCB.

- The analog peripherals voltage supply input is available on a separate  $V_{DDA}$  pin.
- An isolated supply ground connection is provided on  $V_{SSA}$  pin.

The  $V_{DDA}$  supply voltage can be different from  $V_{DD}$ . The presence of  $V_{DDA}$  must be checked before enabling any of the analog peripherals supplied by  $V_{DDA}$  (A/D converter, D/A converter, comparators, operational amplifiers, voltage reference buffer).

The  $V_{DDA}$  supply can be monitored by the Peripheral Voltage Monitoring, and compared with two thresholds (1.65 V for PVM3 or 1.8 V for PVM4), refer to [Section 5.2.3: Peripheral Voltage Monitoring \(PVM\)](#) for more details.

When a single supply is used,  $V_{DDA}$  can be externally connected to  $V_{DD}$  through the external filtering circuit in order to ensure a noise-free  $V_{DDA}$  reference voltage.

### ADC and DAC reference voltage

To ensure a better accuracy on low-voltage inputs and outputs, the user can connect to  $V_{REF+}$  a separate reference voltage lower than  $V_{DDA}$ .  $V_{REF+}$  is the highest voltage, represented by the full scale value, for an analog input (ADC) or output (DAC) signal.

$V_{REF+}$  can be provided either by an external reference or by an internal buffered voltage reference (VREFBUF).

The internal voltage reference is enabled by setting the ENVR bit in the [Section 21.4.1: VREFBUF control and status register \(VREFBUF\\_CSR\)](#). The voltage reference is set to 2.5 V when the VRS bit is set and to 2.048 V when the VRS bit is cleared. The internal voltage reference can also provide the voltage to external components through  $V_{REF+}$  pin. Refer to the device datasheet and to [Section 21: Voltage reference buffer \(VREFBUF\)](#) for further information.

## 5.1.2 Independent I/O supply rail

Some I/Os from Port G (PG[15:2]) are supplied from a separate supply rail. The power supply for this rail can range from 1.08 V to 3.6 V and is provided externally through the  $V_{DDIO2}$  pin. The  $V_{DDIO2}$  voltage level is completely independent from  $V_{DD}$  or  $V_{DDA}$ . The  $V_{DDIO2}$  pin is available only for some packages. Refer to the pinout diagrams or tables in the related device datasheet(s) for I/O list(s).

After reset, the I/Os supplied by  $V_{DDIO2}$  are logically and electrically isolated and therefore are not available. The isolation must be removed before using any I/O from PG[15:2], by setting the IOSV bit in the PWR\_CR2 register, once the  $V_{DDIO2}$  supply is present.

The  $V_{DDIO2}$  supply is monitored by the Peripheral Voltage Monitoring (PVM2) and compared with the internal reference voltage ( $3/4 V_{REFINT}$ , around 0.9V), refer to [Section 5.2.3: Peripheral Voltage Monitoring \(PVM\)](#) for more details.

## 5.1.3 Independent USB transceivers supply<sup>(a)</sup>

The USB transceivers are supplied from a separate  $V_{DDUSB}$  power supply pin.  $V_{DDUSB}$  range is from 3.0 V to 3.6 V and is completely independent from  $V_{DD}$  or  $V_{DDA}$ .

After reset, the USB features supplied by  $V_{DDUSB}$  are logically and electrically isolated and therefore are not available. The isolation must be removed before using the USB OTG peripheral, by setting the USV bit in the PWR\_CR2 register, once the  $V_{DDUSB}$  supply is present.

a. Not available on STM32L471 devices.

The  $V_{DDUSB}$  supply is monitored by the Peripheral Voltage Monitoring (PVM1) and compared with the internal reference voltage ( $V_{REFINT}$ , around 1.2 V), refer to [Section 5.2.3: Peripheral Voltage Monitoring \(PVM\)](#) for more details.

#### 5.1.4 Independent LCD supply<sup>(a)</sup>

The VLCD pin is provided to control the contrast of the glass LCD. This pin can be used in two ways:

- It can receive from an external circuitry the desired maximum voltage that is provided on segment and common lines to the glass LCD by the microcontroller.
- It can also be used to connect an external capacitor that is used by the microcontroller for its voltage step-up converter. This step-up converter is controlled by software to provide the desired voltage to segment and common lines of the glass LCD.

The voltage provided to segment and common lines defines the contrast of the glass LCD pixels. This contrast can be reduced when you configure the dead time between frames.

- When an external power supply is provided to the VLCD pin, it should range from 2.5 V to 3.6 V. It does not depend on  $V_{DD}$ .
- When the LCD is based on the internal step-up converter, the VLCD pin should be connected to a capacitor (see the product datasheet for further information).

#### 5.1.5 Battery backup domain

To retain the content of the Backup registers and supply the RTC function when  $V_{DD}$  is turned off, the VBAT pin can be connected to an optional backup voltage supplied by a battery or by another source.

The VBAT pin powers the RTC unit, the LSE oscillator and the PC13 to PC15 I/Os, allowing the RTC to operate even when the main power supply is turned off. The switch to the  $V_{BAT}$  supply is controlled by the power-down reset embedded in the Reset block.

---

**Warning:** During  $t_{RSTTEMPO}$  (temporization at  $V_{DD}$  startup) or after a PDR has been detected, the power switch between  $V_{BAT}$  and  $V_{DD}$  remains connected to  $V_{BAT}$ . During the startup phase, if  $V_{DD}$  is established in less than  $t_{RSTTEMPO}$  (refer to the datasheet for the value of  $t_{RSTTEMPO}$ ) and  $V_{DD} > V_{BAT} + 0.6$  V, a current may be injected into  $V_{BAT}$  through an internal diode connected between  $V_{DD}$  and the power switch ( $V_{BAT}$ ). If the power supply/battery connected to the VBAT pin cannot support this current injection, it is strongly recommended to connect an external low-drop diode between this power supply and the VBAT pin.

---

If no external battery is used in the application, it is recommended to connect  $V_{BAT}$  externally to  $V_{DD}$  with a 100 nF external ceramic decoupling capacitor.

---

a. Not available on STM32L471/4x5 devices.

When the backup domain is supplied by  $V_{DD}$  (analog switch connected to  $V_{DD}$ ), the following pins are available:

- PC13, PC14 and PC15, which can be used as GPIO pins
- PC13, PC14 and PC15, which can be configured by RTC or LSE (refer to [Section 38.3: RTC functional description on page 1213](#))
- PA0/RTC\_TAMP2 and PE6/RTC\_TAMP3 when they are configured by the RTC as tamper pins

**Note:** *Due to the fact that the analog switch can transfer only a limited amount of current (3 mA), the use of GPIO PC13 to PC15 in output mode is restricted: the speed has to be limited to 2 MHz with a maximum load of 30 pF and these I/Os must not be used as a current source (e.g. to drive a LED).*

When the backup domain is supplied by  $V_{BAT}$  (analog switch connected to  $V_{BAT}$  because  $V_{DD}$  is not present), the following functions are available:

- PC13, PC14 and PC15 can be controlled only by RTC or LSE (refer to [Section 38.3: RTC functional description](#))
- PA0/RTC\_TAMP2 and PE6/RTC\_TAMP3 when they are configured by the RTC as tamper pins

### Backup domain access

After a system reset, the backup domain (RTC registers and backup registers) is protected against possible unwanted write accesses. To enable access to the backup domain, proceed as follows:

1. Enable the power interface clock by setting the PWREN bits in the [Section 6.4.19: APB1 peripheral clock enable register 1 \(RCC\\_APB1ENR1\)](#)
2. Set the DBP bit in the [Power control register 1 \(PWR\\_CR1\)](#) to enable access to the backup domain
3. Select the RTC clock source in the [Backup domain control register \(RCC\\_BDCR\)](#).
4. Enable the RTC clock by setting the RTCEN [15] bit in the [Backup domain control register \(RCC\\_BDCR\)](#).

### VBAT battery charging

When  $V_{DD}$  is present, It is possible to charge the external battery on VBAT through an internal resistance.

The VBAT charging is done either through a 5 kOhm resistor or through a 1.5 kOhm resistor depending on the VBRS bit value in the PWR\_CR4 register.

The battery charging is enabled by setting VBE bit in the PWR\_CR4 register. It is automatically disabled in VBAT mode.

## 5.1.6 Voltage regulator

Two embedded linear voltage regulators supply all the digital circuitries, except for the Standby circuitry and the backup domain. The main regulator output voltage ( $V_{CORE}$ ) can be programmed by software to two different power ranges (Range 1 and Range 2) in order to optimize the consumption depending on the system's maximum operating frequency (refer to [Section 6.2.9: Clock source frequency versus voltage scaling](#) and to [Section 3.3.3: Read access latency](#)).

The voltage regulators are always enabled after a reset. Depending on the application modes, the  $V_{\text{CORE}}$  supply is provided either by the main regulator (MR) or by the low-power regulator (LPR).

- In Run, Sleep and Stop 0 modes, both regulators are enabled and the main regulator (MR) supplies full power to the  $V_{\text{CORE}}$  domain (core, memories and digital peripherals).
- In low-power run and low-power sleep modes, the main regulator is off and the low-power regulator (LPR) supplies low power to the  $V_{\text{CORE}}$  domain, preserving the contents of the registers, SRAM1 and SRAM2.
- In Stop 1 and Stop 2 modes, the main regulator is off and the low-power regulator (LPR) supplies low power to the  $V_{\text{CORE}}$  domain, preserving the contents of the registers, SRAM1 and SRAM2.
- In Standby mode with SRAM2 content preserved (RRS bit is set in the PWR\_CR3 register), the main regulator (MR) is off and the low-power regulator (LPR) provides the supply to SRAM2 only. The core, digital peripherals (except Standby circuitry and backup domain) and SRAM1 are powered off.
- In Standby mode, both regulators are powered off. The contents of the registers, SRAM1 and SRAM2 is lost except for the Standby circuitry and the backup domain.
- In Shutdown mode, both regulators are powered off. When exiting from Shutdown mode, a power-on reset is generated. Consequently, the contents of the registers, SRAM1 and SRAM2 is lost, except for the backup domain.

### 5.1.7 VDD12 domain

$V_{\text{DD12}}$  is intended to be connected with external SMPS (Switched-mode Power Supply) to generate the  $V_{\text{CORE}}$  logic supply in Run, Sleep and Stop 0 modes only.

VDD12 pins correspond to the internal  $V_{\text{CORE}}$  powering the digital part of Core, memories and peripherals. This improves significantly power consumption gain by 50% or more depending of the SMPS performances.

The main benefit occurs in Run and Sleep modes whereas in Stop 0 mode, the gain is less significant.

The [Figure 10](#) shows a schematic to understand how the internal regulator stops supplying  $V_{\text{CORE}}$  when an external voltage  $V_{\text{DD12}}$  is provided.

As VDD12 shares the same pin as output of the internal regulator, applying a slightly higher voltage (typically +50 mV) on the VDD12 blocks the PMOS and the regulator consumption is negligible.

Figure 10. Internal main regulator overview

A switch, controlled by chosen GPIO, is inserted between the SMPS output and VDD12. There are two possible states:

- Connected: Switch is closed so SMPS powers VDD12
- Disconnected: Switch is open and VDD12 is disconnected from SMPS output

Proper software management through GPIOs to enable/disable SMPS and connect/disconnect SMPS through the switch, is required to conform with the rules described below.

(See also [Section 5.1.8: Dynamic voltage scaling management](#))

It is mandatory to respect the following rules to avoid any damage or instability on either digital parts or internal regulators:

- In Run, Sleep and Stop 0 modes,  $V_{DD12}$  can be connected and should respect
  - $V_{DD12} < 1.32\text{ V}$
  - $V_{DD12} \geq V_{CORE} + 50\text{mV}$  giving for Main Regulator
    - Range 1,  $V_{CORE} = 1.2\text{ V}$  so  $V_{DD12}$  should be greater than  $1.25\text{ V}$
    - Range 2,  $V_{CORE} = 1.0\text{ V}$  so  $V_{DD12}$  should be greater than  $1.05\text{ V}$
  - $V_{DD12} \geq 1.08\text{ V}$  in Range 2 when SYSCLK frequency  $\geq 26\text{ MHz}$
- In all other modes, ie LPRun, LPSleep, Stop 1, Stop 2, Standby and Shutdown modes, VDD12 must be disconnected from SMPS output, ie pin must be connected to an high impedance output:
  - VDD12 connected to HiZ (voltage is provided by internal regulators)
- Transitions of VDD12 from connected to disconnected is only allowed when SYSCLK frequency  $\leq 26\text{ MHz}$  to avoid to big voltage drop on main regulator side.

**Note:** In case of reset while having the  $V_{DD12} \leq 1.25\text{ V}$ , VDD12 should switch to HiZ in less than regulator switching time from Range 2 to Range 1 ( $\sim 1\text{ us}$ ).

**Note:** For more details on VDD12 management, refer to AN4978 "Design recommendations for STM32L4xxxx with external SMPS, for ultra-low-power applications with high performance

### 5.1.8 Dynamic voltage scaling management

The dynamic voltage scaling is a power management technique which consists in increasing or decreasing the voltage used for the digital peripherals ( $V_{CORE}$ ), according to the application performance and power consumption needs.

Dynamic voltage scaling to increase  $V_{CORE}$  is known as over-volting. It allows to improve the device performance.

Dynamic voltage scaling to decrease  $V_{CORE}$  is known as under-volting. It is performed to save power, particularly in laptop and other mobile devices where the energy comes from a battery and is thus limited.

The main regulator have two possible programmable voltage range detailed below:

- Range 1: High-performance range.

The main regulator provides a typical output voltage at 1.2 V. The system clock frequency can be up to 80 MHz. The Flash access time for read access is minimum, write and erase operations are possible.

- Range 2: Low-power range.

The main regulator provides a typical output voltage at 1.0 V. The system clock frequency can be up to 26 MHz. The Flash access time for a read access is increased as compared to Range 1; write and erase operations are possible.

Voltage scaling is selected through the VOS bit in the PWR\_CR1 register.

The sequence to go from Range 1 to Range 2 is:

1. Reduce the system frequency to a value lower than 26 MHz
2. Adjust number of wait states according new frequency target in Range 2 (LATENCY bits in the FLASH\_ACR).
3. Program the VOS bits to "10" in the PWR\_CR1 register.

The sequence to go from Range 2 to Range 1 is:

1. Program the VOS bits to "01" in the PWR\_CR1 register.
2. Wait until the VOSF flag is cleared in the PWR\_SR2 register.
3. Adjust number of wait states according new frequency target in Range 1 (LATENCY bits in the FLASH\_ACR).
4. Increase the system frequency.

When supplying VDD12 with an external SMPS, we are defining 3 new states:

- "SMPS range 1": main regulator is in Range 1 and  $V_{CORE}$  is supplied by external SMPS with  $V_{DD12}$  higher than 1.25 V
- "SMPS range 2 High": main regulator is in Range 2 and  $V_{CORE}$  is supplied by external SMPS with  $V_{DD12}$  higher than 1.08 V
- "SMPS range 2 Low": main regulator is in Range 2 and  $V_{CORE}$  is supplied by external SMPS with  $V_{DD12}$  higher than 1.05 V

In order to match the upper rules described in [Section 5.1.7: VDD12 domain](#), the transition sequences can only be one of the following:

- Range 1 to "SMPS Range 1":

1. Start SMPS converter (if not always enabled by HW).
2. Check that SMPS converter output is at the correct level i.e.  $1.25\text{ V} \leq V_{DD12} < 1.32\text{ V}$ .
3. Connect VDD12 to external SMPS converter through the switch.
- Range 2 to “SMPS Range 2 Low & High”:
  1. Start SMPS (if not always enabled by HW).
  2. Check that SMPS output is at the correct level ie  $1.05\text{ V} \leq V_{DD12} < 1.32\text{ V}$ .
  3. Connect VDD12 to external SMPS converter through the switch.

If  $1.08\text{ V} \leq V_{DD12}$  (ie SMPS Range 2 High), then the following steps can be applied:

4. Adjust the number of wait states in the FLASH\_ACR (up to max frequency of Range 1 refer to [Section 3.3.3: Read access latency](#)).
  5. Increase the system frequency up to the maximum allowed value for Voltage Range 1 (ie 80 MHz).
  - “SMPS Range 1” to Range 1:
- or
- SMPS Range 2 Low & High” to Range 2:
    1. If in Range 1, reduce the system frequency to a value lower or equal to 26 MHz.
    2. Adjust number of wait states according new frequency target corresponding to Voltage Range (LATENCY bits in the FLASH\_ACR).
    3. Disconnect VDD12 by opening the switch.
    4. Stop SMPS (if required and not kept always enabled).

If in Range 1, then the following step can be applied:

5. Increase the system frequency if needed.

## 5.2 Power supply supervisor

### 5.2.1 Power-on reset (POR) / power-down reset (PDR) / brown-out reset (BOR)

The device has an integrated power-on reset (POR) / power-down reset (PDR), coupled with a brown-out reset (BOR) circuitry. The BOR is active in all power modes except Shutdown mode, and cannot be disabled.

Five BOR thresholds can be selected through option bytes.

During power-on, the BOR keeps the device under reset until the supply voltage  $V_{DD}$  reaches the specified  $V_{BORx}$  threshold. When  $V_{DD}$  drops below the selected threshold, a device reset is generated. When  $V_{DD}$  is above the  $V_{BORx}$  upper limit, the device reset is released and the system can start.

For more details on the brown-out reset thresholds, refer to the electrical characteristics section in the datasheet.

Figure 11. Brown-out reset waveform

1. The reset temporization  $t_{RSTTEMPO}$  is present only for the BOR lowest threshold ( $V_{BOR0}$ ).

### 5.2.2 Programmable voltage detector (PVD)

You can use the PVD to monitor the  $V_{DD}$  power supply by comparing it to a threshold selected by the PLS[2:0] bits in the [Power control register 2 \(PWR\\_CR2\)](#).

The PVD is enabled by setting the PVDE bit.

A PVDO flag is available, in the [Power status register 2 \(PWR\\_SR2\)](#), to indicate if  $V_{DD}$  is higher or lower than the PVD threshold. This event is internally connected to the EXTI line16 and can generate an interrupt if enabled through the EXTI registers. The rising/falling edge sensitivity of the EXTI Line16 should be configured according to PVD output behavior i.e. if the EXTI line 16 is configured to rising edge sensitivity, the interrupt will be generated when VDD drops below the PVD threshold. As an example the service routine could perform emergency shutdown tasks.

Figure 12. PVD thresholds

### 5.2.3 Peripheral Voltage Monitoring (PVM)

Only  $V_{DD}$  is monitored by default, as it is the only supply required for all system-related functions. The other supplies ( $V_{DDA}$ ,  $V_{DDIO2}$  and  $V_{DDUSB}$ ) can be independent from  $V_{DD}$  and can be monitored with four Peripheral Voltage Monitoring (PVM).

Each of the four PVMx (x=1, 2, 3, 4) is a comparator between a fixed threshold  $V_{PVMx}$  and the selected power supply. PVM0x flags indicate if the independent power supply is higher or lower than the PVMx threshold: PVM0x flag is cleared when the supply voltage is above the PVMx threshold, and is set when the supply voltage is below the PVMx threshold.

Each PVM output is connected to an EXTI line and can generate an interrupt if enabled through the EXTI registers. The PVMx output interrupt is generated when the independent power supply drops below the PVMx threshold and/or when it rises above the PVMx threshold, depending on EXTI line rising/falling edge configuration.

Each PVM can remain active in Stop 0, Stop 1 and Stop 2 modes, and the PVM interrupt can wake up from the Stop mode.

**Table 21. PVM features**

| PVM  | Power supply | PVM threshold              | EXTI line |
|------|--------------|----------------------------|-----------|
| PVM1 | $V_{DDUSB}$  | $V_{PVM1}$ (around 1.2 V)  | 35        |
| PVM2 | $V_{DDIO2}$  | $V_{PVM2}$ (around 0.9 V)  | 36        |
| PVM3 | $V_{DDA}$    | $V_{PVM3}$ (around 1.65 V) | 37        |
| PVM4 | $V_{DDA}$    | $V_{PVM4}$ (around 1.8 V)  | 38        |

The independent supplies ( $V_{DDA}$ ,  $V_{DDIO2}$  and  $V_{DDUSB}$ ) are not considered as present by default, and a logical and electrical isolation is applied to ignore any information coming from the peripherals supplied by these dedicated supplies.

- If these supplies are shorted externally to  $V_{DD}$ , the application should assume they are available without enabling any Peripheral Voltage Monitoring.
- If these supplies are independent from  $V_{DD}$ , the Peripheral Voltage Monitoring (PVM) can be enabled to confirm whether the supply is present or not.

The following sequence must be done before using the USB OTG peripheral:

1. If  $V_{DDUSB}$  is independent from  $V_{DD}$ :
  - a) Enable the PVM1 by setting PVME1 bit in the [Power control register 2 \(PWR\\_CR2\)](#).
  - b) Wait for the PVM1 wakeup time
  - c) Wait until PVM01 bit is cleared in the [Power status register 2 \(PWR\\_SR2\)](#).
  - d) Optional: Disable the PVM1 for consumption saving.
2. Set the USV bit in the [Power control register 2 \(PWR\\_CR2\)](#) to remove the  $V_{DDUSB}$  power isolation.

The following sequence must be done before using any I/O from PG[15:2]:

1. If  $V_{DDIO2}$  is independent from  $V_{DD}$ :
  - a) Enable the PVM2 by setting PVME2 bit in the [Power control register 2 \(PWR\\_CR2\)](#).
  - b) Wait for the PVM2 wakeup time
  - c) Wait until PVMO2 bit is cleared in the [Power status register 2 \(PWR\\_SR2\)](#).
  - d) Optional: Disable the PVM2 for consumption saving.
2. Set the IOSV bit in the [Power control register 2 \(PWR\\_CR2\)](#) to remove the  $V_{DDIO2}$  power isolation.

The following sequence must be done before using any of these analog peripherals: analog to digital converters, digital to analog converters, comparators, operational amplifiers, voltage reference buffer:

1. If  $V_{DDA}$  is independent from  $V_{DD}$ :
  - a) Enable the PVM3 (or PVM4) by setting PVME3 (or PVME4) bit in the [Power control register 2 \(PWR\\_CR2\)](#).
  - b) Wait for the PVM3 (or PVM4) wakeup time
  - c) Wait until PVMO3 (or PVMO4) bit is cleared in the [Power status register 2 \(PWR\\_SR2\)](#).
  - d) Optional: Disable the PVM3 (or PVM4) for consumption saving.
2. Enable the analog peripheral, which automatically removes the  $V_{DDA}$  isolation.

## 5.3 Low-power modes

By default, the microcontroller is in Run mode after a system or a power Reset. Several low-power modes are available to save power when the CPU does not need to be kept running, for example when waiting for an external event. It is up to the user to select the mode that gives the best compromise between low-power consumption, short startup time and available wakeup sources.

The device features seven low-power modes:

- Sleep mode: CPU clock off, all peripherals including Cortex<sup>®</sup>-M4 core peripherals such as NVIC, SysTick, etc. can run and wake up the CPU when an interrupt or an event occurs. Refer to [Section 5.3.4: Sleep mode](#).
- Low-power run mode: This mode is achieved when the system clock frequency is reduced below 2 MHz. The code is executed from the SRAM or the Flash memory. The regulator is in low-power mode to minimize the regulator's operating current. Refer to [Section 5.3.2: Low-power run mode \(LP run\)](#).
- Low-power sleep mode: This mode is entered from the Low-power run mode: Cortex<sup>®</sup>-M4 is off. Refer to [Section 5.3.5: Low-power sleep mode \(LP sleep\)](#).
- Stop 0, Stop 1 and Stop 2 modes: SRAM1, SRAM2 and all registers content are retained. All clocks in the  $V_{CORE}$  domain are stopped, the PLL, the MSI, the HSI16 and the HSE are disabled. The LSI and the LSE can be kept running.

The RTC can remain active (Stop mode with RTC, Stop mode without RTC).

Some peripherals with the wakeup capability can enable the HSI16 RC during the Stop mode to detect their wakeup condition.

In Stop 2 mode, most of the  $V_{CORE}$  domain is put in a lower leakage mode.

Stop 1 offers the largest number of active peripherals and wakeup sources, a smaller wakeup time but a higher consumption than Stop 2. In Stop 0 mode, the main regulator

remains ON, which allows the fastest wakeup time but with much higher consumption. The active peripherals and wakeup sources are the same as in Stop 1 mode.

The system clock, when exiting from Stop 0, Stop 1 or Stop 2 mode, can be either MSI up to 48 MHz or HSI16, depending on the software configuration.

Refer to [Section 5.3.6: Stop 0 mode](#) and [Section 5.3.8: Stop 2 mode](#).

- Standby mode:  $V_{\text{CORE}}$  domain is powered off. However, it is possible to preserve the SRAM2 contents:
  - Standby mode with SRAM2 retention when the bit RRS is set in PWR\_CR3 register. In this case, SRAM2 is supplied by the low-power regulator.
  - Standby mode when the bit RRS is cleared in PWR\_CR3 register. In this case the main regulator and the low-power regulator are powered off.

All clocks in the  $V_{\text{CORE}}$  domain are stopped, the PLL, the MSI, the HSI16 and the HSE are disabled. The LSI and the LSE can be kept running.

The RTC can remain active (Standby mode with RTC, Standby mode without RTC).

The system clock, when exiting Standby modes, is MSI from 1 MHz up to 8 MHz.

Refer to [Section 5.3.9: Standby mode](#).

- Shutdown mode:  $V_{\text{CORE}}$  domain is powered off. All clocks in the  $V_{\text{CORE}}$  domain are stopped, the PLL, the MSI, the HSI16, the LSI and the HSE are disabled. The LSE can be kept running. The system clock, when exiting the Shutdown mode, is MSI at 4 MHz. In this mode, the supply voltage monitoring is disabled and the product behavior is not guaranteed in case of a power voltage drop. Refer to [Section 5.3.10: Shutdown mode](#).

In addition, the power consumption in Run mode can be reduced by one of the following means:

- Slowing down the system clocks
- Gating the clocks to the APB and AHB peripherals when they are unused.

**Figure 13. Low-power modes possible transitions**

Table 22. Low-power mode summary

| Mode name                             | Entry                                                                      | Wakeup source <sup>(1)</sup>                                                    | Wakeup system clock                                                                                        | Effect on clocks                                                   | Voltage regulators        |     |

- Legend: Y = Yes (Enable). O = Optional (Disable by default. Can be enabled by software). - = Not available.
- The Flash can be configured in power-down mode. By default, it is not in power-down mode.
- The SRAM clock can be gated on or off.
- SRAM2 content is preserved when the bit RRS is set in PWR\_CR3 register.
- Not available on STM32L47x/L48x/L49x devices.
- Some peripherals with wakeup from Stop capability can request HSI16 to be enabled. In this case, HSI16 is woken up by the peripheral, and only feeds the peripheral which requested it. HSI16 is automatically put off when the peripheral does not need it anymore.
- Not available on STM32L471/L4x5 devices.
- Not available on STM32L471 devices.
- UART and LPUART reception is functional in Stop mode, and generates a wakeup interrupt on Start, address match or received frame event.
- I2C address detection is functional in Stop mode, and generates a wakeup interrupt in case of address match.
- Voltage scaling Range 1, SMPS Range 1 or SMPS Range 2 High only.
- Not available on STM32L47x/L49x devices.
- I/Os can be configured with internal pull-up, pull-down or floating in Standby mode.
- The I/Os with wakeup from Standby/Shutdown capability are: PA0, PC13, PE6, PA2, PC5.
- I/Os can be configured with internal pull-up, pull-down or floating in Shutdown mode but the configuration is lost when exiting the Shutdown mode.

## Debug mode

By default, the debug connection is lost if the application puts the MCU in Stop 0, Stop1, Stop 2, Standby or Shutdown mode while the debug features are used. This is due to the fact that the Cortex®-M4 core is no longer clocked.

However, by setting some configuration bits in the DBGMCU\_CR register, the software can be debugged even when using the low-power modes extensively. For more details, refer to [Section 48.16.1: Debug support for low-power modes](#).

### 5.3.1 Run mode

#### Slowing down system clocks

In Run mode, the speed of the system clocks (SYSCLK, HCLK, PCLK) can be reduced by programming the prescaler registers. These prescalers can also be used to slow down the peripherals before entering the Sleep mode.

For more details, refer to [Section 6.4.3: Clock configuration register \(RCC\\_CFGR\)](#).

#### Peripheral clock gating

In Run mode, the HCLK and PCLK for individual peripherals and memories can be stopped at any time to reduce the power consumption.

To further reduce the power consumption in Sleep mode, the peripheral clocks can be disabled prior to executing the WFI or WFE instructions.

The peripheral clock gating is controlled by the RCC\_AHBxENR and RCC\_APBxENR registers.

Disabling the peripherals clocks in Sleep mode can be performed automatically by resetting the corresponding bit in the RCC\_AHBxSMENR and RCC\_APBxSMENR registers.

### 5.3.2 Low-power run mode (LP run)

To further reduce the consumption when the system is in Run mode, the regulator can be configured in low-power mode. In this mode, the system frequency should not exceed 2 MHz.

Please refer to the product datasheet for more details on voltage regulator and peripherals operating conditions.

#### I/O states in Low-power run mode

In Low-power run mode, all I/O pins keep the same state as in Run mode.

#### Entering the Low-power run mode

To enter the Low-power run mode, proceed as follows:

1. Optional: Jump into the SRAM and power-down the Flash by setting the RUN\_PD bit in the [Flash access control register \(FLASH\\_ACR\)](#).
2. Decrease the system clock frequency below 2 MHz.
3. Force the regulator in low-power mode by setting the LPR bit in the PWR\_CR1 register.

Refer to [Table 24: Low-power run](#) on how to enter the Low-power run mode.

#### Exiting the Low-power run mode

To exit the Low-power run mode, proceed as follows:

1. Force the regulator in main mode by clearing the LPR bit in the PWR\_CR1 register.
2. Wait until REGLPF bit is cleared in the PWR\_SR2 register.
3. Increase the system clock frequency.

Refer to [Table 24: Low-power run](#) on how to exit the Low-power run mode.

Table 24. Low-power run

| Low-power run mode | Description                                                             |
|--------------------|-------------------------------------------------------------------------|
| Mode entry         | Decrease the system clock frequency below 2 MHz<br>LPR = 1              |
| Mode exit          | LPR = 0<br>Wait until REGLPF = 0<br>Increase the system clock frequency |
| Wakeup latency     | Regulator wakeup time from low-power mode                               |

### 5.3.3 Low power modes

#### Entering low power mode

Low power modes are entered by the MCU by executing the WFI (Wait For Interrupt), or WFE (Wait for Event) instructions, or when the SLEEPONEXIT bit in the Cortex®-M4 System Control register is set on Return from ISR.

Entering Low-power mode through WFI or WFE will be executed only if no interrupt is pending or no event is pending.

#### Exiting low power mode

From Sleep modes, and Stop modes the MCU exit low power mode depending on the way the low power mode was entered:

- If the WFI instruction or Return from ISR was used to enter the low power mode, any peripheral interrupt acknowledged by the NVIC can wake up the device.
- If the WFE instruction is used to enter the low power mode, the MCU exits the low power mode as soon as an event occurs. The wakeup event can be generated either by:
  - NVIC IRQ interrupt.
    - When SEVONPEND = 0 in the Cortex®-M4 System Control register. By enabling an interrupt in the peripheral control register and in the NVIC. When the MCU resumes from WFE, the peripheral interrupt pending bit and the NVIC peripheral IRQ channel pending bit (in the NVIC interrupt clear pending register) have to be cleared.
    - Only NVIC interrupts with sufficient priority will wakeup and interrupt the MCU.
    - When SEVONPEND = 1 in the Cortex®-M4 System Control register.
    - By enabling an interrupt in the peripheral control register and optionally in the NVIC. When the MCU resumes from WFE, the peripheral interrupt pending bit and

when enabled the NVIC peripheral IRQ channel pending bit (in the NVIC interrupt clear pending register) have to be cleared.

All NVIC interrupts will wakeup the MCU, even the disabled ones. Only enabled NVIC interrupts with sufficient priority will wakeup and interrupt the MCU.

- Event

Configuring a EXTI line in event mode. When the CPU resumes from WFE, it is not necessary to clear the EXTI peripheral interrupt pending bit or the NVIC IRQ channel pending bit as the pending bits corresponding to the event line is not set.

It may be necessary to clear the interrupt flag in the peripheral.

From Standby modes, and Shutdown modes the MCU exit low power mode through an external reset (NRST pin), a rising edge on one of the enabled WKUPx pins or a RTC event occurs. An IWDG reset can wake from all but Shutdown (see [Figure 389: RTC block diagrams](#)).

After waking up from Standby or Shutdown mode, program execution restarts in the same way as after a Reset (boot pin sampling, option bytes loading, reset vector is fetched, etc.).

### 5.3.4 Sleep mode

#### I/O states in Sleep mode

In Sleep mode, all I/O pins keep the same state as in Run mode.

#### Entering the Sleep mode

The Sleep mode is entered according [Section : Entering low power mode](#), when the SLEEPDEEP bit in the Cortex®-M4 System Control register is clear.

Refer to [Table 25: Sleep](#) for details on how to enter the Sleep mode.

#### Exiting the Sleep mode

The Sleep mode is exit according [Section : Exiting low power mode](#).

Refer to [Table 25: Sleep](#) for more details on how to exit the Sleep mode.

**Table 25. Sleep**

| Sleep-now mode | Description                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode entry     | WFI (Wait for Interrupt) or WFE (Wait for Event) while: <ul style="list-style-type: none"> <li>– SLEEPDEEP = 0</li> <li>– No interrupt (for WFI) or event (for WFE) is pending</li> </ul> Refer to the Cortex®-M4 System Control register. |

### 5.3.5 Low-power sleep mode (LP sleep)

Please refer to the product datasheet for more details on voltage regulator and peripherals operating conditions.

#### I/O states in Low-power sleep mode

In Low-power sleep mode, all I/O pins keep the same state as in Run mode.

#### Entering the Low-power sleep mode

The Low-power sleep mode is entered from low-power run mode according [Section : Entering low power mode](#), when the SLEEPDEEP bit in the Cortex®-M4 System Control register is clear.

Refer to [Table 26: Low-power sleep](#) for details on how to enter the Low-power sleep mode.

#### Exiting the Low-power sleep mode

The low-power Sleep mode is exit according [Section : Exiting low power mode](#). When exiting the Low-power sleep mode by issuing an interrupt or an event, the MCU is in Low-power run mode.

Refer to [Table 26: Low-power sleep](#) for details on how to exit the Low-power sleep mode.

Table 26. Low-power sleep

| Low-power sleep-now mode | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 5.3.6 Stop 0 mode

The Stop 0 mode is based on the Cortex<sup>®</sup>-M4 deepsleep mode combined with the peripheral clock gating. The voltage regulator is configured in main regulator mode. In Stop 0 mode, all clocks in the V<sub>CORE</sub> domain are stopped; the PLL, the MSI, the HSI16 and the HSE oscillators are disabled. Some peripherals with the wakeup capability (I2Cx (x=1,2,3), U(S)ARTx(x=1,2...5) and LPUART) can switch on the HSI16 to receive a frame, and switch off the HSI16 after receiving the frame if it is not a wakeup frame. In this case, the HSI16 clock is propagated only to the peripheral requesting it.

SRAM1, SRAM2 and register contents are preserved.

The BOR is always available in Stop 0 mode. The consumption is increased when thresholds higher than V<sub>BOR0</sub> are used.

#### I/O states in Stop 0 mode

In the Stop 0 mode, all I/O pins keep the same state as in the Run mode.

#### Entering the Stop 0 mode

The Stop 0 mode is entered according [Section : Entering low power mode](#), when the SLEEPDEEP bit in the Cortex<sup>®</sup>-M4 System Control register is set.

Refer to [Table 27: Stop 0 mode](#) for details on how to enter the Stop 0 mode.

If Flash memory programming is ongoing, the Stop 0 mode entry is delayed until the memory access is finished.

If an access to the APB domain is ongoing, The Stop 0 mode entry is delayed until the APB access is finished.

In Stop 0 mode, the following features can be selected by programming individual control bits:

- Independent watchdog (IWDG): the IWDG is started by writing to its Key register or by hardware option. Once started, it cannot be stopped except by a Reset. See [Section 36.3: IWDG functional description](#).
- real-time clock (RTC): this is configured by the RTCEN bit in the [Backup domain control register \(RCC\\_BDCR\)](#)
- Internal RC oscillator (LSI): this is configured by the LSION bit in the [Control/status register \(RCC\\_CSR\)](#).
- External 32.768 kHz oscillator (LSE): this is configured by the LSEON bit in the [Backup domain control register \(RCC\\_BDCR\)](#).

Several peripherals can be used in Stop 0 mode and can add consumption if they are enabled and clocked by LSI or LSE, or when they request the HSI16 clock: LCD, LPTIM1, LPTIM2, I2Cx (x=1,2,3,4) U(S)ARTx(x=1,2...5), LPUART.

The DAC\_CHx (x=1,2), the OPAMPs and the comparators can be used in Stop 0 mode, the PVMx (x=1,2,3,4) and the PVD as well. If they are not needed, they must be disabled by software to save their power consumptions.

The ADCx (x=1,2,3), temperature sensor and VREFBUF buffer can consume power during the Stop 0 mode, unless they are disabled before entering this mode.

### Exiting the Stop 0 mode

The Stop 0 mode is exit according [Section : Entering low power mode](#).

Refer to [Table 27: Stop 0 mode](#) for details on how to exit Stop 0 mode.

When exiting Stop 0 mode by issuing an interrupt or a wakeup event, the HSI16 oscillator is selected as system clock if the bit STOPWUCK is set in [Clock configuration register \(RCC\\_CFGR\)](#). The MSI oscillator is selected as system clock if the bit STOPWUCK is cleared. The wakeup time is shorter when HSI16 is selected as wakeup system clock. The MSI selection allows wakeup at higher frequency, up to 48 MHz.

When exiting the Stop 0 mode, the MCU is either in Run mode Range 1 or Run Mode Range 2 depending on VOS bit in PWR\_CR1.

Table 27. Stop 0 mode

| Stop 0 mode    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### 5.3.7 Stop 1 mode

The Stop 1 mode is the same as Stop 0 mode except that the main regulator is OFF, and only the low-power regulator is ON. Stop 1 mode can be entered from Run mode and from Low-power run mode.

Refer to [Table 28: Stop 1 mode](#) for details on how to enter and exit Stop 1 mode.

Table 28. Stop 1 mode

| Stop 1 mode    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### 5.3.8 Stop 2 mode

The Stop 2 mode is based on the Cortex<sup>®</sup>-M4 deepsleep mode combined with peripheral clock gating. In Stop 2 mode, all clocks in the V<sub>CORE</sub> domain are stopped, the PLL, the MSI, the HSI16 and the HSE oscillators are disabled. Some peripherals with wakeup capability (I2C3 and LPUART) can switch on the HSI16 to receive a frame, and switch off the HSI16 after receiving the frame if it is not a wakeup frame. In this case the HSI16 clock is propagated only to the peripheral requesting it.

SRAM1, SRAM2 and register contents are preserved.

The BOR is always available in Stop 2 mode. The consumption is increased when thresholds higher than V<sub>BOR0</sub> are used.

*Note: The comparators outputs, the LPUART outputs and the LPTIM1 outputs are forced to low speed (OSPEEDy=00) during the Stop 2 mode.*

## I/O states in Stop 2 mode

In the Stop 2 mode, all I/O pins keep the same state as in the Run mode.

## Entering Stop 2 mode

The Stop 2 mode is entered according [Section : Entering low power mode](#), when the SLEEPDEEP bit in the Cortex®-M4 System Control register is set.

Refer to [Table 29: Stop 2 mode](#) for details on how to enter the Stop 2 mode.

Stop 2 mode can only be entered from Run mode. It is not possible to enter Stop 2 mode from the Low-power run mode.

If Flash memory programming is ongoing, the Stop 2 mode entry is delayed until the memory access is finished.

If an access to the APB domain is ongoing, The Stop 2 mode entry is delayed until the APB access is finished.

In Stop 2 mode, the following features can be selected by programming individual control bits:

- Independent watchdog (IWDG): the IWDG is started by writing to its Key register or by hardware option. Once started it cannot be stopped except by a Reset. See [Section 36.3: IWDG functional description](#) in [Section 36: Independent watchdog \(IWDG\)](#).
- Real-time clock (RTC): this is configured by the RTCEN bit in the [Backup domain control register \(RCC\\_BDCR\)](#)
- Internal RC oscillator (LSI): this is configured by the LSION bit in the [Control/status register \(RCC\\_CSR\)](#).
- External 32.768 kHz oscillator (LSE): this is configured by the LSEON bit in the [Backup domain control register \(RCC\\_BDCR\)](#).

Several peripherals can be used in Stop 2 mode and can add consumption if they are enabled and clocked by LSI or LSE, or when they request the HSI16 clock: LCD, LPTIM1, I2C3, LPUART.

The comparators can be used in Stop 2 mode, the PVMx (x=1,2,3,4) and the PVD as well. If they are not needed, they must be disabled by software to save their power consumptions.

The ADCx, OPAMPx, DAC\_CHx, temperature sensor and VREFBUF buffer can consume power during Stop 2 mode, unless they are disabled before entering this mode.

All the peripherals which cannot be enabled in Stop 2 mode must be either disabled by clearing the Enable bit in the peripheral itself, or put under reset state by setting the corresponding bit in the [AHB1 peripheral reset register \(RCC\\_AHB1RSTR\)](#), [AHB2 peripheral reset register \(RCC\\_AHB2RSTR\)](#), [AHB3 peripheral reset register \(RCC\\_AHB3RSTR\)](#), [APB1 peripheral reset register 1 \(RCC\\_APB1RSTR1\)](#), [APB1 peripheral reset register 2 \(RCC\\_APB1RSTR2\)](#), [APB2 peripheral reset register \(RCC\\_APB2RSTR\)](#).

## Exiting Stop 2 mode

The Stop 2 mode is exit according [Section : Exiting low power mode](#).

Refer to [Table 29: Stop 2 mode](#) for details on how to exit Stop 2 mode.

When exiting Stop 2 mode by issuing an interrupt or a wakeup event, the HSI16 oscillator is selected as system clock if the bit STOPWUCK is set in [Clock configuration register \(RCC\\_CFGR\)](#). The MSI oscillator is selected as system clock if the bit STOPWUCK is cleared. The wakeup time is shorter when HSI16 is selected as wakeup system clock. The MSI selection allows wakeup at higher frequency, up to 48 MHz.

When exiting the Stop 2 mode, the MCU is in Run mode (Range 1 or Range 2 depending on VOS bit in PWR\_CR1).

**Table 29. Stop 2 mode**

| Stop 2 mode    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Wakeup latency | Longest wakeup time between: MSI or HSI16 wakeup time and regulator wakeup time from Low-power mode + Flash wakeup time from Stop 2 mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### 5.3.9 Standby mode

The Standby mode allows to achieve the lowest power consumption with BOR. It is based on the Cortex®-M4 deepsleep mode, with the voltage regulators disabled (except when SRAM2 content is preserved). The PLL, the HSI16, the MSI and the HSE oscillators are also switched off.

SRAM1 and register contents are lost except for registers in the Backup domain and Standby circuitry (see [Figure 9](#)). SRAM2 content can be preserved if the bit RRS is set in the PWR\_CR3 register. In this case the Low-power regulator is ON and provides the supply to SRAM2 only.

The BOR is always available in Standby mode. The consumption is increased when thresholds higher than  $V_{BOR0}$  are used.

### I/O states in Standby mode

In the Standby mode, the IO's are by default in floating state. If the APC bit of PWR\_CR3 register has been set, the I/Os can be configured either with a pull-up (refer to PWR\_PUCRx registers (x=A,B,C,D,E,F,G,H)), or with a pull-down (refer to PWR\_PDCRx registers (x=A,B,C,D,E,F,GH)), or can be kept in analog state if none of the PWR\_PUCRx or PWR\_PDCRx register has been set. The pull-down configuration has highest priority over pull-up configuration in case both PWR\_PUCRx and PWR\_PDCRx are set for the same IO.

Some I/Os (listed in [Section 8.4.1: General-purpose I/O \(GPIO\)](#)) are used for JTAG/SW debug and can only be configured to their respective reset pull-up or pull-down state during Standby mode setting their respective bit in the PWR\_PUCRx or PWR\_PDCRx registers to '1', or will be configured to floating state if the bit is kept at '0'.

The RTC outputs on PC13 are functional in Standby mode. PC14 and PC15 used for LSE are also functional. 5 wakeup pins (WKUPx, x=1,2...5) and the 3 RTC tamper are available.

### Entering Standby mode

The Standby mode is entered according [Section : Entering low power mode](#), when the SLEEPDEEP bit in the Cortex<sup>®</sup>-M4 System Control register is set.

Refer to [Table 30: Standby mode](#) for details on how to enter Standby mode.

In Standby mode, the following features can be selected by programming individual control bits:

- Independent watchdog (IWDG): the IWDG is started by writing to its Key register or by hardware option. Once started it cannot be stopped except by a reset. See [Section 36.3: IWDG functional description](#) in [Section 36: Independent watchdog \(IWDG\)](#).
- real-time clock (RTC): this is configured by the RTCEN bit in the Backup domain control register (RCC\_BDCR)
- Internal RC oscillator (LSI): this is configured by the LSION bit in the Control/status register (RCC\_CSR).
- External 32.768 kHz oscillator (LSE): this is configured by the LSEON bit in the Backup domain control register (RCC\_BDCR)

### Exiting Standby mode

The Standby mode is exited according [Section : Entering low power mode](#). The SBF status flag in the [Power control register 3 \(PWR\\_CR3\)](#) indicates that the MCU was in Standby mode. All registers are reset after wakeup from Standby except for [Power control register 3 \(PWR\\_CR3\)](#).

Refer to [Table 30: Standby mode](#) for more details on how to exit Standby mode.

When exiting Standby mode, I/O's that were configured with pull-up or pull-down during Standby through registers PWR\_PUCRx or PWR\_PDCRx will keep this configuration upon exiting Standby mode until the bit APC of PWR\_CR3 register has been cleared. Once the bit APC is cleared, they will be either configured to their reset values or to the pull-up/pull-down state according the GPIOx\_PUPDR registers. The content of the PWR\_PUCRx or PWR\_PDCRx registers however is not lost and can be re-used for a sub-sequent entering into Standby mode.

Some I/Os (listed in [Section 8.4.1: General-purpose I/O \(GPIO\)](#)) are used for JTAG/SW debug and have internal pull-up or pull-down activated after reset so will be configured at this reset value as well when exiting Standby mode.

For IO's, with a pull-up or pull-down pre-defined after reset (some JTAG/SW IO's) or with GPIOx\_PUPDR programming done after exiting from Standby, in case those programming is different from the PWR\_PUCRx or PWR\_PDCRx programmed value during Standby, both a pull-down and pull-up will be applied until the bit APC is cleared, releasing the PWR\_PUCRx or PWR\_PDCRx programmed value.

**Table 30. Standby mode**

| Standby mode   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Wakeup latency | Reset phase                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 5.3.10 Shutdown mode

The Shutdown mode allows to achieve the lowest power consumption. It is based on the deepsleep mode, with the voltage regulator disabled. The  $V_{CORE}$  domain is consequently powered off. The PLL, the HSI16, the MSI, the LSI and the HSE oscillators are also switched off.

SRAM1, SRAM2 and register contents are lost except for registers in the Backup domain. The BOR is not available in Shutdown mode. No power voltage monitoring is possible in this mode, therefore the switch to Backup domain is not supported.

#### I/O states in Shutdown mode

In the Shutdown mode, are by default in floating state. If the APC bit of PWR\_CR3 register has been set, the I/Os can be configured either with a pull-up (refer to PWR\_PUCRx registers ( $x=A,B,C,D,E,F,G,H$ )), or with a pull-down (refer to PWR\_PDCRx registers ( $x=A,B,C,D,E,F,G,H$ )), or can be kept in analog state if none of the PWR\_PUCRx or PWR\_PDCRx register has been set. The pull-down configuration has highest priority over pull-up configuration in case both PWR\_PUCRx and PWR\_PDCRx are set for the same IO. However this configuration is lost when exiting the Shutdown mode due to the power-on reset.

Some I/Os (listed in [Section 8.4.1: General-purpose I/O \(GPIO\)](#)) are used for JTAG/SW debug and can only be configured to their respective reset pull-up or pull-down state during Standby mode setting their respective bit in the PWR\_PUCRx or PWR\_PDCRx registers to '1', or will be configured to floating state if the bit is kept at '0'.

The RTC outputs on PC13 are functional in Shutdown mode. PC14 and PC15 used for LSE are also functional. 5 wakeup pins (WKUPx,  $x=1,2...5$ ) and the 3 RTC tamperers are available.

#### Entering Shutdown mode

The Shutdown mode is entered according [Entering low power mode](#), when the SLEEPDEEP bit in the Cortex®-M4 System Control register is set.

Refer to [Table 31: Shutdown mode](#) for details on how to enter Shutdown mode.

In Shutdown mode, the following features can be selected by programming individual control bits:

- real-time clock (RTC): this is configured by the RTCEN bit in the Backup domain control register (RCC\_BDCR). Caution: in case of VDD power-down the RTC content will be lost.
- external 32.768 kHz oscillator (LSE): this is configured by the LSEON bit in the Backup domain control register (RCC\_BDCR)

#### Exiting Shutdown mode

The Shutdown mode is exit according [Section : Exiting low power mode](#). A power-on reset occurs when exiting from Shutdown mode. All registers (except for the ones in the Backup domain) are reset after wakeup from Shutdown.

Refer to [Table 31: Shutdown mode](#) for more details on how to exit Shutdown mode.

When exiting Shutdown mode, I/Os that were configured with pull-up or pull-down during Shutdown through registers PWR\_PUCRx or PWR\_PDCRx will lose their configuration and

will be configured in floating state or to their pull-up pull-down reset value (for some I/Os listed in [Section 8.4.1: General-purpose I/O \(GPIO\)](#)).

**Table 31. Shutdown mode**

| Shutdown mode  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode entry     | WFI (Wait for Interrupt) or WFE (Wait for Event) while: <ul style="list-style-type: none"> <li>– SLEEPDEEP bit is set in Cortex®-M4 System Control register</li> <li>– No interrupt (for WFI) or event (for WFE) is pending</li> <li>– LPMS = “1XX” in PWR_CR1</li> <li>– WUFx bits are cleared in power status register 1 (PWR_SR1)</li> </ul>                                                                                                                   |
|                | On return from ISR while: <ul style="list-style-type: none"> <li>– SLEEPDEEP bit is set in Cortex®-M4 System Control register</li> <li>– SLEEPONEXT = 1</li> <li>– No interrupt is pending</li> <li>– LPMS = “1XX” in PWR_CR1 and</li> <li>– WUFx bits are cleared in power status register 1 (PWR_SR1)</li> <li>– The RTC flag corresponding to the chosen wakeup source (RTC Alarm A, RTC Alarm B, RTC wakeup, tamper or timestamp flags) is cleared</li> </ul> |

| Wakeup latency | Reset phase                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### 5.3.11 Auto-wakeup from low-power mode

The RTC can be used to wakeup the MCU from low-power mode without depending on an external interrupt (Auto-wakeup mode). The RTC provides a programmable time base for waking up from Stop (0, 1 or 2) or Standby mode at regular intervals. For this purpose, two of the three alternative RTC clock sources can be selected by programming the RTCSEL[1:0] bits in the [Backup domain control register \(RCC\\_BDCR\)](#):

- Low-power 32.768 kHz external crystal oscillator (LSE OSC)  
This clock source provides a precise time base with very low-power consumption.
- Low-power internal RC Oscillator (LSI)  
This clock source has the advantage of saving the cost of the 32.768 kHz crystal. This internal RC Oscillator is designed to add minimum power consumption.

To wakeup from Stop mode with an RTC alarm event, it is necessary to:

- Configure the EXTI Line 18 to be sensitive to rising edge
- Configure the RTC to generate the RTC alarm

To wakeup from Standby mode, there is no need to configure the EXTI Line 18.

To wakeup from Stop mode with an RTC wakeup event, it is necessary to:

- Configure the EXTI Line 20 to be sensitive to rising edge
- Configure the RTC to generate the RTC alarm

To wakeup from Standby mode, there is no need to configure the EXTI Line 20.

The LCD Start of frame interrupt can also be used as a periodic wakeup from Stop (0, 1 or 2) mode. The LCD is not available in Standby mode.

The LCD clock is derived from the RTC clock selected by RTCSEL[1:0].

## 5.4 PWR registers

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

### 5.4.1 Power control register 1 (PWR\_CR1)

Address offset: 0x00

Reset value: 0x0000 0200. This register is reset after wakeup from Standby mode.

|      |      |      |      |      |          |      |      |      |      |      |      |      |           |      |      |
|------|------|------|------|------|----------|------|------|------|------|------|------|------|-----------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26       | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18        | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. |
|      |      |      |      |      |          |      |      |      |      |      |      |      |           |      |      |
| 15   | 14   | 13   | 12   | 11   | 10       | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2         | 1    | 0    |
| Res. | LPR  | Res. | Res. | Res. | VOS[1:0] |      | DBP  | Res. | Res. | Res. | Res. | Res. | LPMS[2:0] |      |      |
|      | rw   |      |      |      | rw       | rw   | rw   |      |      |      |      |      | rw        | rw   | rw   |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **LPR**: Low-power run

When this bit is set, the regulator is switched from main mode (MR) to low-power mode (LPR).

*Note: Stop 2 mode cannot be entered when LPR bit is set. Stop 1 is entered instead.*

Bits 13:11 Reserved, must be kept at reset value.

Bits 10:9 **VOS**: Voltage scaling range selection

00: Cannot be written (forbidden by hardware)

01: Range 1

10: Range 2

11: Cannot be written (forbidden by hardware)

Bit 8 **DBP**: Disable backup domain write protection

In reset state, the RTC and backup registers are protected against parasitic write access. This bit must be set to enable write access to these registers.

0: Access to RTC and Backup registers disabled

1: Access to RTC and Backup registers enabled

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **LPMS[2:0]**: Low-power mode selection

These bits select the low-power mode entered when CPU enters the deepsleep mode.

000: Stop 0 mode

001: Stop 1 mode

010: Stop 2 mode

011: Standby mode

1xx: Shutdown mode

*Note: If LPR bit is set, Stop 2 mode cannot be selected and Stop 1 mode shall be entered instead of Stop 2.*

*In Standby mode, SRAM2 can be preserved or not, depending on RRS bit configuration in PWR\_CR3.*

## 5.4.2 Power control register 2 (PWR\_CR2)

Address offset: 0x04

Reset value: 0x0000 0000. This register is reset when exiting the Standby mode.

|      |      |      |      |      |      |      |      |       |       |       |       |          |      |      |      |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **USV**:  $V_{DDUSB}$  USB supply valid (this bit is reserved for STM32L471 devices)

This bit is used to validate the  $V_{DDUSB}$  supply for electrical and logical isolation purpose. Setting this bit is mandatory to use the USB OTG\_FS peripheral. If  $V_{DDUSB}$  is not always present in the application, the PVM can be used to determine whether this supply is ready or not.

0:  $V_{DDUSB}$  is not present. Logical and electrical isolation is applied to ignore this supply.

1:  $V_{DDUSB}$  is valid.

Bit 9 **IOSV**:  $V_{DDIO2}$  Independent I/Os supply valid

This bit is used to validate the  $V_{DDIO2}$  supply for electrical and logical isolation purpose.

Setting this bit is mandatory to use PG[15:2]. If  $V_{DDIO2}$  is not always present in the application, the PVM can be used to determine whether this supply is ready or not.

0:  $V_{DDIO2}$  is not present. Logical and electrical isolation is applied to ignore this supply.

1:  $V_{DDIO2}$  is valid.

Bit 8 Reserved, must be kept at reset value.

Bit 7 **PVME4**: Peripheral voltage monitoring 4 enable:  $V_{DDA}$  vs. 1.8 V

0: PVM4 ( $V_{DDA}$  monitoring vs. 1.8 V threshold) disable.

1: PVM4 ( $V_{DDA}$  monitoring vs. 1.8 V threshold) enable.

Bit 6 **PVME3**: Peripheral voltage monitoring 3 enable:  $V_{DDA}$  vs. 1.62 V

0: PVM3 ( $V_{DDA}$  monitoring vs. 1.62 V threshold) disable.

1: PVM3 ( $V_{DDA}$  monitoring vs. 1.62 V threshold) enable.

Bit 5 **PVME2**: Peripheral voltage monitoring 2 enable:  $V_{DDIO2}$  vs. 0.9 V

0: PVM2 ( $V_{DDIO2}$  monitoring vs. 0.9 V threshold) disable.

1: PVM2 ( $V_{DDIO2}$  monitoring vs. 0.9 V threshold) enable.

Bit 4 **PVME1**: Peripheral voltage monitoring 1 enable:  $V_{DDUSB}$  vs. 1.2 V (this bit is reserved for STM32L471 devices)

0: PVM1 ( $V_{DDUSB}$  monitoring vs. 1.2 V threshold) disable.

1: PVM1 ( $V_{DDUSB}$  monitoring vs. 1.2 V threshold) enable.

Bits 3:1 **PLS[2:0]**: Programmable voltage detector level selection.

These bits select the voltage threshold detected by the programmable voltage detector:

000:  $V_{PVD0}$  around 2.0 V

001:  $V_{PVD1}$  around 2.2 V

010:  $V_{PVD2}$  around 2.4 V

011:  $V_{PVD3}$  around 2.5 V

100:  $V_{PVD4}$  around 2.6 V

101:  $V_{PVD5}$  around 2.8 V

110:  $V_{PVD6}$  around 2.9 V

111: External input analog voltage PVD\_IN (compared internally to VREFINT)

*Note: These bits are write-protected when the bit PVDL (PVD Lock) is set in the SYSCFG\_CBR register.*

*These bits are reset only by a system reset.*

Bit 0 **PVDE**: Programmable voltage detector enable

0: Programmable voltage detector disable.

1: Programmable voltage detector enable.

*Note: This bit is write-protected when the bit PVDL (PVD Lock) is set in the SYSCFG\_CBR register.*

*This bit is reset only by a system reset.*

### 5.4.3 Power control register 3 (PWR\_CR3)

Address offset: 0x08

Reset value: 0x0000 8000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|       |      |      |      |      |      |      |      |      |      |      |           |           |           |           |           |
|-------|------|------|------|------|------|------|------|------|------|------|-----------|-----------|-----------|-----------|-----------|

|       |      |      |      |      |      |      |      |      |      |      |           |           |           |           |           |
| 15    | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4         | 3         | 2         | 1         | 0         |
| EIWUL | Res. | Res. | Res. | Res. | APC  | Res. | RRS  | Res. | Res. | Res. | EWUP<br>5 | EWUP<br>4 | EWUP<br>3 | EWUP<br>2 | EWUP<br>1 |
| rw    |      |      |      |      | rw   |      | rw   |      |      |      | rw        | rw        | rw        | rw        | rw        |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **EIWUL**: Enable internal wakeup line

0: Internal wakeup line disable.

1: Internal wakeup line enable.

Bits 14:11 Reserved, must be kept at reset value.

Bit 10 **APC**: Apply pull-up and pull-down configuration

When this bit is set, the I/O pull-up and pull-down configurations defined in the PWR\_PUCRx and PWR\_PDCRx registers are applied. When this bit is cleared, the PWR\_PUCRx and PWR\_PDCRx registers are not applied to the I/Os, instead the I/Os will be in floating mode during Standby or configured according GPIO controller GPIOx\_PUPDR register during RUN mode.

Bit 9 Reserved, must be kept at reset value.

Bit 8 **RRS**: SRAM2 retention in Standby mode

0: SRAM2 is powered off in Standby mode (SRAM2 content is lost).

1: SRAM2 is powered by the low-power regulator in Standby mode (SRAM2 content is kept).

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **EWUP5**: Enable Wakeup pin WKUP5

When this bit is set, the external wakeup pin WKUP5 is enabled and triggers a wakeup from Standby or Shutdown event when a rising or a falling edge occurs. The active edge is configured via the WP5 bit in the PWR\_CR4 register.

Bit 3 **EWUP4**: Enable Wakeup pin WKUP4

When this bit is set, the external wakeup pin WKUP4 is enabled and triggers a wakeup from Standby or Shutdown event when a rising or a falling edge occurs. The active edge is configured via the WP4 bit in the PWR\_CR4 register.

Bit 2 **EWUP3**: Enable Wakeup pin WKUP3

When this bit is set, the external wakeup pin WKUP3 is enabled and triggers a wakeup from Standby or Shutdown event when a rising or a falling edge occurs. The active edge is configured via the WP3 bit in the PWR\_CR4 register.

Bit 1 **EWUP2**: Enable Wakeup pin WKUP2

When this bit is set, the external wakeup pin WKUP2 is enabled and triggers a wakeup from Standby or Shutdown event when a rising or a falling edge occurs. The active edge is configured via the WP2 bit in the PWR\_CR4 register.

Bit 0 **EWUP1**: Enable Wakeup pin WKUP1

When this bit is set, the external wakeup pin WKUP1 is enabled and triggers a wakeup from Standby or Shutdown event when a rising or a falling edge occurs. The active edge is configured via the WP1 bit in the PWR\_CR4 register.

#### 5.4.4 Power control register 4 (PWR\_CR4)

Address offset: 0x0C

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

|      |      |      |      |      |      | rw   | rw   |      |      |      | rw   | rw   | rw   | rw   | rw   |

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **VBR5**: V<sub>BAT</sub> battery charging resistor selection  
 0: Charge V<sub>BAT</sub> through a 5 kOhms resistor  
 1: Charge V<sub>BAT</sub> through a 1.5 kOhms resistor

Bit 8 **VBE**: V<sub>BAT</sub> battery charging enable  
 0: V<sub>BAT</sub> battery charging disable  
 1: V<sub>BAT</sub> battery charging enable

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **WP5**: Wakeup pin WKUP5 polarity  
 This bit defines the polarity used for an event detection on external wake-up pin, WKUP5  
 0: Detection on high level (rising edge)  
 1: Detection on low level (falling edge)

Bit 3 **WP4**: Wakeup pin WKUP4 polarity  
 This bit defines the polarity used for an event detection on external wake-up pin, WKUP4  
 0: Detection on high level (rising edge)  
 1: Detection on low level (falling edge)

Bit 2 **WP3**: Wakeup pin WKUP3 polarity  
 This bit defines the polarity used for an event detection on external wake-up pin, WKUP3  
 0: Detection on high level (rising edge)  
 1: Detection on low level (falling edge)

Bit 1 **WP2**: Wakeup pin WKUP2 polarity  
 This bit defines the polarity used for an event detection on external wake-up pin, WKUP2  
 0: Detection on high level (rising edge)  
 1: Detection on low level (falling edge)

Bit 0 **WP1**: Wakeup pin WKUP1 polarity  
 This bit defines the polarity used for an event detection on external wake-up pin, WKUP1  
 0: Detection on high level (rising edge)  
 1: Detection on low level (falling edge)

### 5.4.5 Power status register 1 (PWR\_SR1)

Address offset: 0x10

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: 2 additional APB cycles are needed to read this register vs. a standard APB read.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

| r    |      |      |      |      |      |      | r    |      |      |      | r    | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **WUFI**: Wakeup flag internal

This bit is set when a wakeup is detected on the internal wakeup line. It is cleared when all internal wakeup sources are cleared.

Bits 14:9 Reserved, must be kept at reset value.

Bit 8 **SBF**: Standby flag

This bit is set by hardware when the device enters the Standby mode and is cleared by setting the CSBF bit in the PWR\_SCR register, or by a power-on reset. It is not cleared by the system reset.

0: The device did not enter the Standby mode

1: The device entered the Standby mode

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **WUF5**: Wakeup flag 5

This bit is set when a wakeup event is detected on wakeup pin, WKUP5. It is cleared by writing '1' in the CWUF5 bit of the PWR\_SCR register.

Bit 3 **WUF4**: Wakeup flag 4

This bit is set when a wakeup event is detected on wakeup pin, WKUP4. It is cleared by writing '1' in the CWUF4 bit of the PWR\_SCR register.

Bit 2 **WUF3**: Wakeup flag 3

This bit is set when a wakeup event is detected on wakeup pin, WKUP3. It is cleared by writing '1' in the CWUF3 bit of the PWR\_SCR register.

Bit 1 **WUF2**: Wakeup flag 2

This bit is set when a wakeup event is detected on wakeup pin, WKUP2. It is cleared by writing '1' in the CWUF2 bit of the PWR\_SCR register.

Bit 0 **WUF1**: Wakeup flag 1

This bit is set when a wakeup event is detected on wakeup pin, WKUP1. It is cleared by writing '1' in the CWUF1 bit of the PWR\_SCR register.

### 5.4.6 Power status register 2 (PWR\_SR2)

Address offset: 0x14

Reset value: 0x0000 0000. This register is partially reset when exiting Standby/Shutdown modes.

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **PVMO4**: Peripheral voltage monitoring output:  $V_{DDA}$  vs. 1.8 V

0:  $V_{DDA}$  voltage is above PVM4 threshold (around 1.8 V).

1:  $V_{DDA}$  voltage is below PVM4 threshold (around 1.8 V).

*Note: PVMO4 is cleared when PVM4 is disabled ( $PVME4 = 0$ ). After enabling PVM4, the PVM4 output is valid after the PVM4 wakeup time.*

Bit 14 **PVMO3**: Peripheral voltage monitoring output:  $V_{DDA}$  vs. 1.62 V

0:  $V_{DDA}$  voltage is above PVM3 threshold (around 1.62 V).

1:  $V_{DDA}$  voltage is below PVM3 threshold (around 1.62 V).

*Note: PVMO3 is cleared when PVM3 is disabled ( $PVME3 = 0$ ). After enabling PVM3, the PVM3 output is valid after the PVM3 wakeup time.*

Bit 13 **PVMO2**: Peripheral voltage monitoring output:  $V_{DDIO2}$  vs. 0.9 V

0:  $V_{DDIO2}$  voltage is above PVM2 threshold (around 0.9 V).

1:  $V_{DDIO2}$  voltage is below PVM2 threshold (around 0.9 V).

*Note: PVMO2 is cleared when PVM2 is disabled ( $PVME2 = 0$ ). After enabling PVM2, the PVM2 output is valid after the PVM2 wakeup time.*

Bit 12 **PVMO1**: Peripheral voltage monitoring output:  $V_{DDUSB}$  vs. 1.2 V (this bit is reserved on STM32L471)

0:  $V_{DDUSB}$  voltage is above PVM1 threshold (around 1.2 V).

1:  $V_{DDUSB}$  voltage is below PVM1 threshold (around 1.2 V).

*Note: PVMO1 is cleared when PVM1 is disabled ( $PVME1 = 0$ ). After enabling PVM1, the PVM1 output is valid after the PVM1 wakeup time.*

Bit 11 **PVDO**: Programmable voltage detector output

0:  $V_{DD}$  is above the selected PVD threshold

1:  $V_{DD}$  is below the selected PVD threshold

Bit 10 **VOSF**: Voltage scaling flag

A delay is required for the internal regulator to be ready after the voltage scaling has been changed. VOSF indicates that the regulator reached the voltage level defined with VOS bits of the PWR\_CR1 register.

0: The regulator is ready in the selected voltage range

1: The regulator output voltage is changing to the required voltage level

Bit 9 **REGLPF**: Low-power regulator flag

This bit is set by hardware when the MCU is in Low-power run mode. When the MCU exits from the Low-power run mode, this bit remains at 1 until the regulator is ready in main mode. A polling on this bit must be done before increasing the product frequency.

This bit is cleared by hardware when the regulator is ready.

0: The regulator is ready in main mode (MR)

1: The regulator is in low-power mode (LPR)

Bit 8 **REGLPS**: Low-power regulator started

This bit provides the information whether the low-power regulator is ready after a power-on reset or a Standby/Shutdown. If the Standby mode is entered while REGLPS bit is still cleared, the wakeup from Standby mode time may be increased.

0: The low-power regulator is not ready

1: The low-power regulator is ready

Bits 7:0 Reserved, must be kept at reset value.

### 5.4.7 Power status clear register (PWR\_SCR)

Address offset: 0x18

Reset value: 0x0000 0000.

Access: 3 additional APB cycles are needed to write this register vs. a standard APB write.

|      |      |      |      |      |      |      |      |      |      |      |        |        |        |        |        |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **CSBF**: Clear standby flag

Setting this bit clears the SBF flag in the PWR\_SR1 register.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **CWUF5**: Clear wakeup flag 5

Setting this bit clears the WUF5 flag in the PWR\_SR1 register.

Bit 3 **CWUF4**: Clear wakeup flag 4

Setting this bit clears the WUF4 flag in the PWR\_SR1 register.

Bit 2 **CWUF3**: Clear wakeup flag 3

Setting this bit clears the WUF3 flag in the PWR\_SR1 register.

Bit 1 **CWUF2**: Clear wakeup flag 2

Setting this bit clears the WUF2 flag in the PWR\_SR1 register.

Bit 0 **CWUF1**: Clear wakeup flag 1

Setting this bit clears the WUF1 flag in the PWR\_SR1 register.

### 5.4.8 Power Port A pull-up control register (PWR\_PUCRA)

Address offset: 0x20.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

| rw   |      | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **PU15**: Port A pull-up bit 15

When set, this bit activates the pull-up on PA[15] when APC bit is set in PWR\_CR3 register.  
If the corresponding PD15 bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

Bit 14 Reserved, must be kept at reset value.

Bits 13:0 **PUy**: Port A pull-up bit y (y=0..13)

When set, this bit activates the pull-up on PA[y] when APC bit is set in PWR\_CR3 register. If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

### 5.4.9 Power Port A pull-down control register (PWR\_PDCRA)

Address offset: 0x24.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **PD14**: Port A pull-down bit 14

When set, this bit activates the pull-down on PA[14] when APC bit is set in PWR\_CR3 register.

Bit 13 Reserved, must be kept at reset value.

Bits 12:0 **PDy**: Port A pull-down bit y (y=0..12)

When set, this bit activates the pull-down on PA[y] when APC bit is set in PWR\_CR3 register.

### 5.4.10 Power Port B pull-up control register (PWR\_PUCRB)

Address offset: 0x28.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PUy**: Port B pull-up bit y (y=0..15)

When set, this bit activates the pull-up on PB[y] when APC bit is set in PWR\_CR3 register. If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

#### 5.4.11 Power Port B pull-down control register (PWR\_PDCRB)

Address offset: 0x2C.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:5 **PDy**: Port B pull-down bit y (y=5..15)

When set, this bit activates the pull-down on PB[y] when APC bit is set in PWR\_CR3 register.

Bit 4 Reserved, must be kept at reset value.

Bits 3:0 **PDy**: Port B pull-down bit y (y=0..3)

When set, this bit activates the pull-down on PB[y] when APC bit is set in PWR\_CR3 register.

#### 5.4.12 Power Port C pull-up control register (PWR\_PUCRC)

Address offset: 0x30.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

| PU15 | PU14 | PU13 | PU12 | PU11 | PU10 | PU9  | PU8  | PU7  | PU6  | PU5  | PU4  | PU3  | PU2  | PU1  | PU0  |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PUy**: Port C pull-up bit y (y=0..15)

When set, this bit activates the pull-up on PC[y] when APC bit is set in PWR\_CR3 register. If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

#### 5.4.13 Power Port C pull-down control register (PWR\_PDCRC)

Address offset: 0x34.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PDy**: Port C pull-down bit y (y=0..15)

When set, this bit activates the pull-down on PC[y] when APC bit is set in PWR\_CR3 register.

#### 5.4.14 Power Port D pull-up control register (PWR\_PUCRD)

Address offset: 0x38.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PUy**: Port D pull-up bit y (y=0..15)

When set, this bit activates the pull-up on PD[y] when APC bit is set in PWR\_CR3 register. If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

#### 5.4.15 Power Port D pull-down control register (PWR\_PDCRD)

Address offset: 0x3C.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PDy**: Port D pull-down bit y (y=0..15)

When set, this bit activates the pull-down on PD[y] when APC bit is set in PWR\_CR3 register.

#### 5.4.16 Power Port E pull-up control register (PWR\_PUCRE)

Address offset: 0x20.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PUy**: Port E pull-up bit y (y=0..15)

When set, this bit activates the pull-up on PE[y] when APC bit is set in PWR\_CR3 register. If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

#### 5.4.17 Power Port E pull-down control register (PWR\_PDCRE)

Address offset: 0x44.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PDy**: Port E pull-down bit y (y=0..15)

When set, this bit activates the pull-down on PE[y] when APC bit is set in PWR\_CR3 register.

#### 5.4.18 Power Port F pull-up control register (PWR\_PUCRF)

Address offset: 0x48.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PUy**: Port F pull-up bit y (y=0..15)

When set, this bit activates the pull-up on PF[y] when APC bit is set in PWR\_CR3 register. If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

#### 5.4.19 Power Port F pull-down control register (PWR\_PDCRF)

Address offset: 0x4C.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PDy**: Port F pull-down bit y (y=0..15)

When set, this bit activates the pull-down on PF[y] when APC bit is set in PWR\_CR3 register.

#### 5.4.20 Power Port G pull-up control register (PWR\_PUCRG)

Address offset: 0x50.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PUy**: Port G pull-up bit y (y=0..15)

When set, this bit activates the pull-up on PG[y] when APC bit is set in PWR\_CR3 register. If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

#### 5.4.21 Power Port G pull-down control register (PWR\_PDCRG)

Address offset: 0x54.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PDy**: Port G pull-down bit y (y=0..15)

When set, this bit activates the pull-down on PG[y] when APC bit is set in PWR\_CR3 register.

#### 5.4.22 Power Port H pull-up control register (PWR\_PUCRH)

Address offset: 0x58.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PUy**: Port H pull-up bit y (y=0..15)

When set, this bit activates the pull-up on PH[y] when APC bit is set in PWR\_CR3 register.  
If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority (PWR\_PUCRH[15:2][15:2] are reserved on STM32L47x/L48x devices).

#### 5.4.23 Power Port H pull-down control register (PWR\_PDCRH)

Address offset: 0x5C.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PDy**: Port H pull-down bit y (y=0..15)

When set, this bit activates the pull-down on PH[y] when APC bit is set in PWR\_CR3 register (PWR\_PDCRH[15:2] are reserved on STM32L47x/L48x devices).

#### 5.4.24 Power Port I pull-up control register (PWR\_PUCRI)

This register applies only to STM32L49x/L4Ax.

Address offset: 0x60.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

Bits 31:16 Reserved, must be kept at reset value.

Bits 11:0 **PUy**: Port I pull-up bit y (y=0..11)

When set, this bit activates the pull-up on PI[y] when APC bit is set in PWR\_CR3 register. If the corresponding PDy bit is also set, the pull-up is not activated and the pull-down is activated instead with highest priority.

#### 5.4.25 Power Port I pull-down control register (PWR\_PDCRI)

This register applies only to STM32L49x/L4Ax.

Address offset: 0x64.

Reset value: 0x0000 0000. This register is neither reset when exiting Standby or Shutdown mode, nor by the PWRRST bit in the RCC\_APB1RSTR1 register.

Access: Additional APB cycles are needed to access this register vs. a standard APB access (3 for a write and 2 for a read).

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 6 Reset and clock control (RCC)

### 6.1 Reset

There are three types of reset, defined as system reset, power reset and backup domain reset.

#### 6.1.1 Power reset

A power reset is generated when one of the following events occurs:

1. a Brown-out reset (BOR).
2. when exiting from Standby mode.
3. when exiting from Shutdown mode.

A Brown-out reset, including power-on or power-down reset (POR/PDR), sets all registers to their reset values except the Backup domain.

When exiting Standby mode, all registers in the  $V_{CORE}$  domain are set to their reset value. Registers outside the  $V_{CORE}$  domain (RTC, WKUP, IWDG, and Standby/Shutdown modes control) are not impacted.

When exiting Shutdown mode, a Brown-out reset is generated, resetting all registers except those in the Backup domain.

#### 6.1.2 System reset

A system reset sets all registers to their reset values unless specified otherwise in the register description.

A system reset is generated when one of the following events occurs:

1. A low level on the NRST pin (external reset)
2. Window watchdog event (WWDG reset)
3. Independent watchdog event (IWDG reset)
4. A firewall event (FIREWALL reset)
5. A software reset (SW reset) (see [Software reset](#))
6. Low-power mode security reset (see [Low-power mode security reset](#))
7. Option byte loader reset (see [Option byte loader reset](#))
8. A Brown-out reset

The reset source can be identified by checking the reset flags in the Control/Status register, RCC\_CSR (see [Section 6.4.30: Control/status register \(RCC\\_CSR\)](#)).

These sources act on the NRST pin and it is always kept low during the delay phase. The RESET service routine vector is fixed at address 0x0000\_0004 in the memory map.

The system reset signal provided to the device is output on the NRST pin. The pulse generator guarantees a minimum reset pulse duration of 20  $\mu$ s for each internal reset source. In case of an external reset, the reset pulse is generated while the NRST pin is asserted low.

In case on an internal reset, the internal pull-up  $R_{PU}$  is deactivated in order to save the power consumption through the pull-up resistor.

Figure 14. Simplified diagram of the reset circuit

### Software reset

The SYSRESETREQ bit in Cortex®-M4 Application Interrupt and Reset Control Register must be set to force a software reset on the device (refer to the STM32 Cortex®-M4 MCUs and MPUs programming manual (PM0214)).

### Low-power mode security reset

To prevent that critical applications mistakenly enter a low-power mode, two low-power mode security resets are available. If enabled in option bytes, the resets are generated in the following conditions:

1. Entering Standby mode: this type of reset is enabled by resetting nRST\_STDBY bit in User option Bytes. In this case, whenever a Standby mode entry sequence is successfully executed, the device is reset instead of entering Standby mode.
2. Entering Stop mode: this type of reset is enabled by resetting nRST\_STOP bit in User option bytes. In this case, whenever a Stop mode entry sequence is successfully executed, the device is reset instead of entering Stop mode.
3. Entering Shutdown mode: this type of reset is enabled by resetting nRST\_SHDW bit in User option bytes. In this case, whenever a Shutdown mode entry sequence is successfully executed, the device is reset instead of entering Shutdown mode.

For further information on the User Option Bytes, refer to [Section 3.4.1: Option bytes description](#).

### Option byte loader reset

The option byte loader reset is generated when the OBL\_LAUNCH bit (bit 27) is set in the FLASH\_CR register. This bit is used to launch the option byte loading by software.

## 6.1.3 Backup domain reset

The backup domain has two specific resets.

A backup domain reset is generated when one of the following events occurs:

1. Software reset, triggered by setting the BDRST bit in the *Backup domain control register (RCC\_BDCR)*.
2.  $V_{DD}$  or  $V_{BAT}$  power on, if both supplies have previously been powered off.

A backup domain reset only affects the LSE oscillator, the RTC, the Backup registers and the RCC Backup domain control register.

## 6.2 Clocks

Four different clock sources can be used to drive the system clock (SYSCLK):

- HSI16 (high speed internal) 16 MHz RC oscillator clock
- MSI (multispeed internal) RC oscillator clock
- HSE oscillator clock, from 4 to 48 MHz
- PLL clock

The MSI is used as system clock source after startup from Reset, configured at 4 MHz.

The devices have the following additional clock sources:

- 32 kHz low speed internal RC (LSI RC) which drives the independent watchdog and optionally the RTC used for Auto-wakeup from Stop and Standby modes.
- 32.768 kHz low speed external crystal (LSE crystal) which optionally drives the real-time clock (RTCCLK).
- RC 48 MHz internal clock sources (HSI48) to potentially drive the USB FS, the SDMMC and the RNG (only for STM32L49x/L4Ax devices).

Each clock source can be switched on or off independently when it is not used, to optimize power consumption.

Several prescalers can be used to configure the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB, the APB1 and the APB2 domains is 80 MHz.

All the peripheral clocks are derived from their bus clock (HCLK, PCLK1 or PCLK2) except:

- The 48 MHz clock, used for USB OTG FS, SDMMC and RNG. This clock is derived (selected by software) from one of the four following sources:
  - main PLL VCO (PLL48M1CLK)
  - PLLSAI1 VCO (PLL48M2CLK)
  - MSI clock
  - HSI48 internal oscillator (only for STM32L49x/L4Ax devices)

When the MSI clock is auto-trimmed with the LSE, it can be used by the USB OTG FS device.

When available, the HSI48 48 MHz clock can be coupled to the clock recovery system allowing adequate clock connection for the USB OTG FS (Crystal less solution).

- The ADCs clock which is derived (selected by software) from one of the three following sources:
  - system clock (SYSCLK)
  - PLLSAI1 VCO (PLLADC1CLK)
  - PLLSAI2 VCO (PLLADC2CLK)
- The U(S)ARTs clocks which are derived (selected by software) from one of the four following sources:
  - system clock (SYSCLK)
  - HSI16 clock
  - LSE clock
  - APB1 or APB2 clock (PCLK1 or PCLK2 depending on which APB is mapped the U(S)ART)

The wakeup from Stop mode is supported only when the clock is HSI16 or LSE.

- The I<sup>2</sup>Cs clocks which are derived (selected by software) from one of the three following sources:
  - system clock (SYSCLK)
  - HSI16 clock
  - APB1 clock (PCLK1)

The wakeup from Stop mode is supported only when the clock is HSI16.

- The SAI1 and SAI2 clocks which are derived (selected by software) from one of the five following sources:
  - an external clock mapped on SAI1\_EXTCLK for SAI1 and SAI2\_EXTCLK for SAI2
  - PLLSAI1 VCO (PLLSAI1CLK)
  - PLLSAI2 VCO (PLLSAI2CLK)
  - main PLL VCO (PLLSAI3CLK)
  - HSI16 clock (only for STM32L49x/L4Ax devices)

- The SWPMI1 clock which is derived (selected by software) from one of the two following sources:
  - HSI16 clock
  - APB1 clock (PCLK1)

The wakeup from Stop mode is supported only when the clock is HSI16.

- The DFSDM1 clock which is derived (selected by software) from one of the two following sources:

- system clock (SYSCLK)
- APB2 clock (PCLK2)
- The low-power timers (LPTIMx) clock which are derived (selected by software) from one of the five following sources:
  - LSI clock
  - LSE clock
  - HSI16 clock
  - APB1 clock (PCLK1)
  - External clock mapped on LPTIMx\_IN1

The functionality in Stop mode (including wakeup) is supported only when the clock is LSI or LSE, or in external clock mode.

- The RTC and LCD clock which is derived (selected by software) from one of the three following sources:
  - LSE clock
  - LSI clock
  - HSE clock divided by 32

The functionality in Stop mode (including wakeup) is supported only when the clock is LSI or LSE.

- The IWDG clock which is always the LSI clock.

The RCC feeds the Cortex<sup>®</sup> System Timer (SysTick) external clock with the AHB clock (HCLK) divided by 8. The SysTick can work either with this clock or directly with the Cortex<sup>®</sup> clock (HCLK), configurable in the SysTick Control and Status Register.

FCLK acts as Cortex<sup>®</sup>-M4 free-running clock. For more details refer to the STM32 Cortex<sup>®</sup>-M4 MCUs and MPUs programming manual (PM0214).

Figure 15. Clock tree (for STM32L47x/L48x devices)

1. For full details about the internal and external clock source characteristics, please refer to the “Electrical characteristics” section in your device datasheet.
2. The ADC clock can be derived from the AHB clock of the ADC bus interface, divided by a programmable factor (1, 2 or 4). When the programmable factor is ‘1’, the AHB prescaler must be equal to ‘1’.

Figure 16. Clock tree (for STM32L49x/L4Ax devices)

6.2.1 HSE clock

The high speed external clock signal (HSE) can be generated from two possible clock sources:

- HSE external crystal/ceramic resonator
- HSE user external clock

The resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. The loading capacitance values must be adjusted according to the selected oscillator.

Figure 17. HSE/ LSE clock sources

| Clock source               | Hardware configuration                                                               |
|----------------------------|--------------------------------------------------------------------------------------|
| External clock             |    |
| Crystal/Ceramic resonators |  |

### External crystal/ceramic resonator (HSE crystal)

The 4 to 48 MHz external oscillator has the advantage of producing a very accurate rate on the main clock.

The associated hardware configuration is shown in [Figure 17](#). Refer to the electrical characteristics section of the *datasheet* for more details.

The HSERDY flag in the [Clock control register \(RCC\\_CR\)](#) indicates if the HSE oscillator is stable or not. At startup, the clock is not released until this bit is set by hardware. An interrupt can be generated if enabled in the [Clock interrupt enable register \(RCC\\_CIER\)](#).

The HSE Crystal can be switched on and off using the HSEON bit in the [Clock control register \(RCC\\_CR\)](#).

### External source (HSE bypass)

In this mode, an external clock source must be provided. It can have a frequency of up to 48 MHz. You select this mode by setting the HSEBYP and HSEON bits in the [Clock control register \(RCC\\_CR\)](#). The external clock signal (square, sinus or triangle) with ~40-60 % duty cycle depending on the frequency (refer to the *datasheet*) has to drive the OSC\_IN pin while the OSC\_OUT pin can be used a GPIO. See [Figure 17](#).

## 6.2.2 HSI16 clock

The HSI16 clock signal is generated from an internal 16 MHz RC Oscillator.

The HSI16 RC oscillator has the advantage of providing a clock source at low cost (no external components). It also has a faster startup time than the HSE crystal oscillator however, even with calibration the frequency is less accurate than an external crystal oscillator or ceramic resonator.

The HSI16 clock can be selected as system clock after wakeup from Stop modes (Stop 0, Stop 1 or Stop 2). Refer to [Section 6.3: Low-power modes](#). It can also be used as a backup clock source (auxiliary clock) if the HSE crystal oscillator fails. Refer to [Section 6.2.10: Clock security system \(CSS\)](#).

### Calibration

RC oscillator frequencies can vary from one chip to another due to manufacturing process variations, this is why each device is factory calibrated by ST for 1 % accuracy at  $T_A=25^{\circ}\text{C}$ .

After reset, the factory calibration value is loaded in the HSICAL[7:0] bits in the [Internal clock sources calibration register \(RCC\\_ICSCR\)](#).

If the application is subject to voltage or temperature variations this may affect the RC oscillator speed. You can trim the HSI16 frequency in the application using the HSITRIM[4:0] bits (or HSITRIM[6:0] on STM32L49x/L4Ax devices) in the [Internal clock sources calibration register \(RCC\\_ICSCR\)](#).

For more details on how to measure the HSI16 frequency variation, refer to [Section 6.2.18: Internal/external clock measurement with TIM15/TIM16/TIM17](#).

The HSIRDY flag in the [Clock control register \(RCC\\_CR\)](#) indicates if the HSI16 RC is stable or not. At startup, the HSI16 RC output clock is not released until this bit is set by hardware.

The HSI16 RC can be switched on and off using the HSION bit in the [Clock control register \(RCC\\_CR\)](#).

The HSI16 signal can also be used as a backup source (Auxiliary clock) if the HSE crystal oscillator fails. Refer to [Section 6.2.10: Clock security system \(CSS\) on page 216](#).

### 6.2.3 MSI clock

The MSI clock signal is generated from an internal RC oscillator. Its frequency range can be adjusted by software by using the MSIRANGE[3:0] bits in the [Clock control register \(RCC\\_CR\)](#). Twelve frequency ranges are available: 100 kHz, 200 kHz, 400 kHz, 800 kHz, 1 MHz, 2 MHz, 4 MHz (default value), 8 MHz, 16 MHz, 24 MHz, 32 MHz and 48 MHz.

The MSI clock is used as system clock after restart from Reset, wakeup from Standby and Shutdown low-power modes. After restart from Reset, the MSI frequency is set to its default value 4 MHz. Refer to [Section 6.3: Low-power modes](#).

The MSI clock can be selected as system clock after a wakeup from Stop mode (Stop 0, Stop 1 or Stop 2). Refer to [Section 6.3: Low-power modes](#). It can also be used as a backup clock source (auxiliary clock) if the HSE crystal oscillator fails. Refer to [Section 6.2.10: Clock security system \(CSS\)](#).

The MSI RC oscillator has the advantage of providing a low-cost (no external components) low-power clock source. In addition, when used in PLL-mode with the LSE, it provides a very accurate clock source which can be used by the USB OTG FS device, and feed the main PLL to run the system at the maximum speed 80 MHz.

The MSIRDY flag in the [Clock control register \(RCC\\_CR\)](#) indicates whether the MSI RC is stable or not. At startup, the MSI RC output clock is not released until this bit is set by hardware. The MSI RC can be switched on and off by using the MSION bit in the [Clock control register \(RCC\\_CR\)](#).

#### Hardware auto calibration with LSE (PLL-mode)

When a 32.768 kHz external oscillator is present in the application, it is possible to configure the MSI in a PLL-mode by setting the MSIPLEN bit in the [Clock control register \(RCC\\_CR\)](#). When configured in PLL-mode, the MSI automatically calibrates itself thanks to the LSE. This mode is available for all MSI frequency ranges. At 48 MHz, the MSI in PLL-mode can be used for the USB OTG FS device, saving the need of an external high-speed crystal.

#### Software calibration

The MSI RC oscillator frequency can vary from one chip to another due to manufacturing process variations, this is why each device is factory calibrated by ST for 1 % accuracy at an ambient temperature, TA, of 25 °C. After reset, the factory calibration value is loaded in the MSICAL[7:0] bits in the [Internal clock sources calibration register \(RCC\\_ICSCR\)](#). If the application is subject to voltage or temperature variations, this may affect the RC oscillator speed. You can trim the MSI frequency in the application by using the MSITRIM[7:0] bits in the RCC\_ICSCR register. For more details on how to measure the MSI frequency variation please refer to [Section 6.2.18: Internal/external clock measurement with TIM15/TIM16/TIM17](#).

*Note:* Hardware auto calibration with LSE must not be used in conjunction with software calibration.

### 6.2.4 HSI48 clock (only valid for STM32L49x/L4Ax devices)

The HSI48 clock signal is generated from an internal 48 MHz RC oscillator and can be used directly for USB and for random number generator (RNG) as well as SDMMC.

The internal 48 MHz RC oscillator is mainly dedicated to provide a high precision clock to the USB peripheral by means of a special Clock Recovery System (CRS) circuitry. The CRS can use the USB SOF signal, the LSE or an external signal to automatically and quickly adjust the oscillator frequency on-fly. It is disabled as soon as the system enters Stop or Standby mode. When the CRS is not used, the HSI48 RC oscillator runs on its default frequency which is subject to manufacturing process variations.

For more details on how to configure and use the CRS peripheral please refer to [Section 7: Clock recovery system \(CRS\)](#).

The HSI48RDY flag in the Clock recovery RC register (RCC\_CRRCR) indicates whether the HSI48 RC oscillator is stable or not. At startup, the HSI48 RC oscillator output clock is not released until this bit is set by hardware.

The HSI48 can be switched on and off using the HSI48ON bit in the Clock recovery RC register (RCC\_CRRCR).

### 6.2.5 PLL

The device embeds 3 PLLs: PLL, PLLSAI1, PLLSAI2. Each PLL provides up to three independent outputs. The internal PLLs can be used to multiply the HSI16, HSE or MSI output clock frequency. The PLLs input frequency must be between 4 and 16 MHz. The selected clock source is divided by a programmable factor PLLM from 1 to 8 to provide a clock frequency in the requested input range. Refer to [Figure 15: Clock tree \(for STM32L47x/L48x devices\)](#) and [Figure 16: Clock tree \(for STM32L49x/L4Ax devices\)](#) and [PLL configuration register \(RCC\\_PLLCFGR\)](#).

The PLLs configuration (selection of the input clock and multiplication factor) must be done before enabling the PLL. Once the PLL is enabled, these parameters cannot be changed.

To modify the PLL configuration, proceed as follows:

1. Disable the PLL by setting PLLON to 0 in [Clock control register \(RCC\\_CR\)](#).
2. Wait until PLLRDY is cleared. The PLL is now fully stopped.
3. Change the desired parameter.
4. Enable the PLL again by setting PLLON to 1.
5. Enable the desired PLL outputs by configuring PLLPEN, PLLQEN, PLLREN in [PLL configuration register \(RCC\\_PLLCFGR\)](#).

An interrupt can be generated when the PLL is ready, if enabled in the [Clock interrupt enable register \(RCC\\_CIER\)](#).

The same procedure is applied for changing the configuration of the PLLSAI1 or PLLSAI2:

1. Disable the PLLSAI1/PLLSAI2 by setting PLLSAI1ON/PLLSAI2ON to 0 in [Clock control register \(RCC\\_CR\)](#).
2. Wait until PLLSAI1RDY/PLLSAI2RDY is cleared. The PLLSAI1/PLLSAI2 is now fully stopped.
3. Change the desired parameter.
4. Enable the PLLSAI1/PLLSAI2 again by setting PLLSAI1ON/PLLSAI2ON to 1.
5. Enable the desired PLL outputs by configuring PLLSAI1PEN/PLLSAI2PEN, PLLSAI1QEN, PLLSAI1REN/PLLSAI2REN in [PLLSAI1 configuration register \(RCC\\_PLLSAI1CFGR\)](#) and [PLLSAI2 configuration register \(RCC\\_PLLSAI2CFGR\)](#).

The PLL output frequency must not exceed 80 MHz.

The enable bit of each PLL output clock (PLL PEN, PLL QEN, PLL REN, PLLSAI1PEN, PLLSAI1QEN, PLLSAI1REN, PLLSAI2PEN and PLLSAI2REN) can be modified at any time without stopping the corresponding PLL. PLLREN cannot be cleared if PLLCLK is used as system clock.

### 6.2.6 LSE clock

The LSE crystal is a 32.768 kHz Low Speed External crystal or ceramic resonator. It has the advantage of providing a low-power but highly accurate clock source to the real-time clock peripheral (RTC) for clock/calendar or other timing functions.

The LSE crystal is switched on and off using the LSEON bit in [Backup domain control register \(RCC\\_BDCR\)](#). The crystal oscillator driving strength can be changed at runtime using the LSEDRV[1:0] bits in the [Backup domain control register \(RCC\\_BDCR\)](#) to obtain the best compromise between robustness and short start-up time on one side and low-power-consumption on the other side. The LSE drive can be decreased to the lower drive capability (LSEDRV=00) when the LSE is ON. However, once LSEDRV is selected, the drive capability can not be increased if LSEON=1.

The LSE RDY flag in the [Backup domain control register \(RCC\\_BDCR\)](#) indicates whether the LSE crystal is stable or not. At startup, the LSE crystal output clock signal is not released until this bit is set by hardware. An interrupt can be generated if enabled in the [Clock interrupt enable register \(RCC\\_CIER\)](#).

#### External source (LSE bypass)

In this mode, an external clock source must be provided. It can have a frequency of up to 1 MHz. You select this mode by setting the LSEBYP and LSEON bits in the [Backup domain control register \(RCC\\_BDCR\)](#). The external clock signal (square, sinus or triangle) with ~50 % duty cycle has to drive the OSC32\_IN pin while the OSC32\_OUT pin can be used as GPIO. See [Figure 17](#).

### 6.2.7 LSI clock

The LSI RC acts as a low-power clock source that can be kept running in Stop and Standby mode for the independent watchdog (IWDG), RTC and LCD. The clock frequency is 32 kHz. For more details, refer to the electrical characteristics section of the datasheets.

The LSI RC can be switched on and off using the LSION bit in the [Control/status register \(RCC\\_CSR\)](#).

The LSIRDY flag in the [Control/status register \(RCC\\_CSR\)](#) indicates if the LSI oscillator is stable or not. At startup, the clock is not released until this bit is set by hardware. An interrupt can be generated if enabled in the [Clock interrupt enable register \(RCC\\_CIER\)](#).

### 6.2.8 System clock (SYSCLK) selection

Four different clock sources can be used to drive the system clock (SYSCLK):

- MSI oscillator
- HSI16 oscillator
- HSE oscillator
- PLL

The system clock maximum frequency is 80 MHz. After a system reset, the MSI oscillator, at 4 MHz, is selected as system clock. When a clock source is used directly or through the PLL as a system clock, it is not possible to stop it.

A switch from one clock source to another occurs only if the target clock source is ready (clock stable after startup delay or PLL locked). If a clock source which is not yet ready is selected, the switch will occur when the clock source becomes ready. Status bits in the [Clock control register \(RCC\\_CR\)](#) and [Clock configuration register \(RCC\\_CFGR\)](#) indicate which clock(s) is (are) ready and which clock is currently used as a system clock.

## 6.2.9 Clock source frequency versus voltage scaling

The following table gives the different clock source frequencies depending on the product voltage range.

**Table 33. Clock source frequency**

| Product voltage range  | Clock frequency |        |        |                               |
|------------------------|-----------------|--------|--------|-------------------------------|
|                        | MSI             | HSI16  | HSE    | PLL/PLLSAI1/PLLSAI2           |
| Range 1 <sup>(1)</sup> | 48 MHz          | 16 MHz | 48 MHz | 80 MHz<br>(VCO max = 344 MHz) |
| Range 2 <sup>(2)</sup> | 24 MHz range    | 16 MHz | 26 MHz | 26 MHz<br>(VCO max = 128 MHz) |

1. Also for SMPS Range1 and SMPS Range2 High

2. Also for SMPS Range2 Low

## 6.2.10 Clock security system (CSS)

Clock Security System can be activated by software. In this case, the clock detector is enabled after the HSE oscillator startup delay, and disabled when this oscillator is stopped.

If a failure is detected on the HSE clock, the HSE oscillator is automatically disabled, a clock failure event is sent to the break input of the advanced-control timers (TIM1/TIM8 and TIM15/16/17) and an interrupt is generated to inform the software about the failure (Clock Security System Interrupt CSSI), allowing the MCU to perform rescue operations. The CSSI is linked to the Cortex<sup>®</sup>-M4 NMI (Non-Maskable Interrupt) exception vector.

**Note:** *Once the CSS is enabled and if the HSE clock fails, the CSS interrupt occurs and a NMI is automatically generated. The NMI will be executed indefinitely unless the CSS interrupt pending bit is cleared. As a consequence, in the NMI ISR user must clear the CSS interrupt by setting the CSSC bit in the [Clock interrupt clear register \(RCC\\_CICR\)](#).*

If the HSE oscillator is used directly or indirectly as the system clock (indirectly means: it is used as PLL input clock, and the PLL clock is used as system clock), a detected failure causes a switch of the system clock to the MSI or the HSI16 oscillator depending on the STOPWUCK configuration in the [Clock configuration register \(RCC\\_CFGR\)](#), and the disabling of the HSE oscillator. If the HSE clock (divided or not) is the clock entry of the PLL used as system clock when the failure occurs, the PLL is disabled too.

### 6.2.11 Clock security system on LSE

A Clock Security System on LSE can be activated by software writing the LSECSSON bit in the [Backup domain control register \(RCC\\_BDCR\)](#). This bit can be disabled only by a hardware reset or RTC software reset, or after a failure detection on LSE. LSECSSON must be written after LSE and LSI are enabled (LSEON and LSION enabled) and ready (LSERDY and LSIRDY set by hardware), and after the RTC clock has been selected by RTCSEL.

The CSS on LSE is working in all modes except VBAT. It is working also under system reset (excluding power on reset). If a failure is detected on the external 32 kHz oscillator, the LSE clock is no longer supplied to the RTC but no hardware action is made to the registers. If the MSI was in PLL-mode, this mode is disabled.

In Standby mode a wakeup is generated. In other modes an interrupt can be sent to wakeup the software (see [Clock interrupt enable register \(RCC\\_CIER\)](#), [Clock interrupt flag register \(RCC\\_CIFR\)](#), [Clock interrupt clear register \(RCC\\_CICR\)](#)).

The software MUST then disable the LSECSSON bit, stop the defective 32 kHz oscillator (disabling LSEON), and change the RTC clock source (no clock or LSI or HSE, with RTCSEL), or take any required action to secure the application.

The frequency of LSE oscillator have to be higher than 30 kHz to avoid false positive CSS detection.

The CSS provides no protection in case the expected frequency is exceeded.

### 6.2.12 USB Clock

The USB clock can be derived from either:

- The RC 48 MHz (HSI48) clock (only for STM32L49x/L4Ax devices)
- The MSI clock when auto-trimmed by the LSE

The HSI48 48 MHz clock can be coupled to the clock recovery system allowing adequate clock connection for the USB OTG FS in device mode (removing the need for an external high speed or low speed crystal).

The MSI clock when auto-trimmed by the LSE, can provide a very accurate clock source which can be used by the USB OTG FS in device mode (removing the need for an external high speed crystal).

### 6.2.13 ADC clock

The ADC clock is derived from the system clock, or from the PLLSAI1 or the PLLSAI2 output. It can reach 80 MHz and can be divided by the following prescalers values: 1,2,4,6,8,10,12,16,32,64,128 or 256 by configuring the ADC123\_CCR register. It is asynchronous to the AHB clock. Alternatively, the ADC clock can be derived from the AHB clock of the ADC bus interface, divided by a programmable factor (1, 2 or 4). This programmable factor is configured using the CKMODE bit fields in the ADC123\_CCR.

If the programmed factor is '1', the AHB prescaler must be set to '1'.

### 6.2.14 RTC clock

The RTCCLK clock source can be either the HSE/32, LSE or LSI clock. It is selected by programming the RTCSEL[1:0] bits in the [Backup domain control register \(RCC\\_BDCR\)](#). This selection cannot be modified without resetting the Backup domain. The system must

always be configured so as to get a PCLK frequency greater than or equal to the RTCCLK frequency for a proper operation of the RTC.

The LSE clock is in the Backup domain, whereas the HSE and LSI clocks are not. Consequently:

- If LSE is selected as RTC clock:
  - The RTC continues to work even if the  $V_{DD}$  supply is switched off, provided the  $V_{BAT}$  supply is maintained.
- If LSI is selected as the RTC clock:
  - The RTC state is not guaranteed if the  $V_{DD}$  supply is powered off.
- If the HSE clock divided by a prescaler is used as the RTC clock:
  - The RTC state is not guaranteed if the  $V_{DD}$  supply is powered off or if the internal voltage regulator is powered off (removing power from the  $V_{CORE}$  domain).

When the RTC clock is LSE or LSI, the RTC remains clocked and functional under system reset.

### 6.2.15 Timer clock

The timer clock frequencies are automatically defined by hardware. There are two cases:

1. If the APB prescaler equals 1, the timer clock frequencies are set to the same frequency as that of the APB domain.
2. Otherwise, they are set to twice ( $\times 2$ ) the frequency of the APB domain.

### 6.2.16 Watchdog clock

If the Independent watchdog (IWDG) is started by either hardware option or software access, the LSI oscillator is forced ON and cannot be disabled. After the LSI oscillator temporization, the clock is provided to the IWDG.

### 6.2.17 Clock-out capability

- MCO  
The microcontroller clock output (MCO) capability allows the clock to be output onto the external MCO pin. One of eight clock signals can be selected as the MCO clock.
  - LSI
  - LSE
  - SYSCLK
  - HSI16
  - HSI48 (for STM32L49x/L4Ax devices)
  - HSE
  - PLLCLK
  - MSI

The selection is controlled by the MCOSEL[2:0] (or MCOSEL[3:0] for STM32L49x/L4Ax devices) bits of the [Clock configuration register \(RCC\\_CFGR\)](#). The

selected clock can be divided with the MCOPRE[2:0] field of the [Clock configuration register \(RCC\\_CFGR\)](#).

- LSCO

Another output (LSCO) allows a low speed clock to be output onto the external LSCO pin:

- LSI
- LSE

This output remains available in Stop (Stop 0, Stop 1 and Stop 2) and Standby modes. The selection is controlled by the LSCOSEL, and enabled with the LSCOEN in the [Backup domain control register \(RCC\\_BDCR\)](#).

The MCO clock output requires the corresponding alternate function selected on the MCO pin, the LSCO pin should be left in default POR state.

### 6.2.18 Internal/external clock measurement with TIM15/TIM16/TIM17

It is possible to indirectly measure the frequency of all on-board clock sources by mean of the TIM15, TIM16 or TIM17 channel 1 input capture, as represented on [Figure 18](#), [Figure 19](#) and [Figure 20](#).

**Figure 18. Frequency measurement with TIM15 in capture mode**

The input capture channel of the Timer 15 can be a GPIO line or an internal clock of the MCU. This selection is performed through the TI1\_RMP bit in the TIM15\_OR register. The possibilities are the following ones:

- TIM15 Channel1 is connected to the GPIO. Refer to the alternate function mapping in the device datasheets.
- TIM15 Channel1 is connected to the LSE.

**Figure 19. Frequency measurement with TIM16 in capture mode**

The input capture channel of the Timer 16 can be a GPIO line or an internal clock of the MCU. This selection is performed through the TI1\_RMP[1:0] bits in the TIM16\_OR register. The possibilities are the following ones:

- TIM16 Channel1 is connected to the GPIO. Refer to the alternate function mapping in the device datasheets.
- TIM16 Channel1 is connected to the LSI clock.
- TIM16 Channel1 is connected to the LSE clock.
- TIM16 Channel1 is connected to the RTC wakeup interrupt signal. In this case the RTC interrupt should be enabled.

**Figure 20. Frequency measurement with TIM17 in capture mode**

The input capture channel of the Timer 17 can be a GPIO line or an internal clock of the MCU. This selection is performed through the TI1\_RMP[1:0] bits in the TIM17\_OR register. The possibilities are the following ones:

- TIM17 Channel1 is connected to the GPIO. Refer to the alternate function mapping in the device datasheets.
- TIM17 Channel1 is connected to the MSI Clock.
- TIM17 Channel1 is connected to the HSE/32 Clock.
- TIM17 Channel1 is connected to the microcontroller clock output (MCO), this selection is controlled by the MCO[2:0] (or MCOSEL[3:0] for STM32L49x/L4Ax devices) bits of the Clock configuration register (RCC\_CFGR).

### Calibration of the HSI16 and the MSI

For TIM15 and TIM16, the primary purpose of connecting the LSE to the channel 1 input capture is to be able to precisely measure the HSI16 and MSI system clocks (for this, either the HSI16 or MSI should be used as the system clock source). The number of HSI16 (MSI, respectively) clock counts between consecutive edges of the LSE signal provides a measure of the internal clock period. Taking advantage of the high precision of LSE crystals (typically a few tens of ppm's), it is possible to determine the internal clock frequency with the same resolution, and trim the source to compensate for manufacturing, process, temperature and/or voltage related frequency deviations.

The MSI and HSI16 oscillator both have dedicated user-accessible calibration bits for this purpose.

The basic concept consists in providing a relative measurement (e.g. the HSI16/LSE ratio): the precision is therefore closely related to the ratio between the two clock sources. The higher the ratio is, the better the measurement will be.

If LSE is not available, HSE/32 will be the better option in order to reach the most precise calibration possible.

It is however not possible to have a good enough resolution when the MSI clock is low (typically below 1 MHz). In this case, it is advised to:

- accumulate the results of several captures in a row
- use the timer's input capture prescaler (up to 1 capture every 8 periods)
- use the RTC wakeup interrupt signal (when the RTC is clocked by the LSE) as the input for the channel1 input capture. This improves the measurement precision. For this purpose the RTC wakeup interrupt must be enable.

### Calibration of the LSI

The calibration of the LSI will follow the same pattern that for the HSI16, but changing the reference clock. It will be necessary to connect LSI clock to the channel 1 input capture of the TIM16. Then define the HSE as system clock source, the number of his clock counts between consecutive edges of the LSI signal provides a measure of the internal low speed clock period.

The basic concept consists in providing a relative measurement (e.g. the HSE/LSI ratio): the precision is therefore closely related to the ratio between the two clock sources. The higher the ratio is, the better the measurement will be.

#### 6.2.19 Peripheral clock enable register (RCC\_AHBxENR, RCC\_APBxENRy)

Each peripheral clock can be enabled by the xxxxEN bit of the RCC\_AHBxENR, RCC\_APBxENRy registers.

When the peripheral clock is not active, the peripheral registers read or write accesses are not supported.

The enable bit has a synchronization mechanism to create a glitch free clock for the peripheral. After the enable bit is set, there is a 2 clock cycles delay before the clock be active.

**Caution:** Just after enabling the clock for a peripheral, software must wait for a delay before accessing the peripheral registers.

## 6.3 Low-power modes

- AHB and APB peripheral clocks, including DMA clock, can be disabled by software.
- Sleep and Low Power Sleep modes stops the CPU clock. The memory interface clocks (Flash and SRAM1 and SRAM2 interfaces) can be stopped by software during sleep mode. The AHB to APB bridge clocks are disabled by hardware during Sleep mode when all the clocks of the peripherals connected to them are disabled.
- Stop modes (Stop 0, Stop 1 and Stop 2) stops all the clocks in the  $V_{CORE}$  domain and disables the three PLL, the HSI16, the MSI and the HSE oscillators.

All U(S)ARTs, LPUARTs and I<sup>2</sup>Cs have the capability to enable the HSI16 oscillator even when the MCU is in Stop mode (if HSI16 is selected as the clock source for that peripheral).

All U(S)ARTs and LPUARTs can also be driven by the LSE oscillator when the system is in Stop mode (if LSE is selected as clock source for that peripheral) and the LSE oscillator is enabled (LSEON). In that case the LSE remains always ON in Stop mode (they do not have the capability to turn on the LSE oscillator).
- Standby and Shutdown modes stops all the clocks in the  $V_{CORE}$  domain and disables the PLL, the HSI16, the MSI and the HSE oscillators.

The CPU's deepsleep mode can be overridden for debugging by setting the DBG\_STOP or DBG\_STANDBY bits in the DBGMCU\_CR register.

When leaving the Stop modes (Stop 0, Stop 1 or Stop 2), the system clock is either MSI or HSI16, depending on the software configuration of the STOPWUCK bit in the RCC\_CFGR register. The frequency (range and user trim) of the MSI oscillator is the one configured before entering Stop mode. The user trim of HSI16 is kept. If the MSI was in PLL-mode before entering Stop mode, the PLL-mode stabilization time must be waited for after wakeup even if the LSE was kept ON during the Stop mode.

When leaving the Standby and Shutdown modes, the system clock is MSI. The MSI frequency at wakeup from Standby mode is configured with the MSISRANGE is the RCC\_CSR register, from 1 to 8 MHz. The MSI frequency at wakeup from Shutdown mode is 4 MHz. The user trim is lost.

If a Flash memory programming operation is on going, Stop, Standby and Shutdown modes entry is delayed until the Flash memory interface access is finished. If an access to the APB domain is ongoing, Stop, Standby and Shutdown modes entry is delayed until the APB access is finished.

## 6.4 RCC registers

### 6.4.1 Clock control register (RCC\_CR)

Address offset: 0x00

Reset value: 0x0000 0063. HSEBYP is cleared upon power-on reset. It is not affected upon other types of reset.

Access: no wait state, word, half-word and byte access

|      |      |              |             |              |             |           |       |               |      |      |      |           |          |         |        |

1: PLLSAI1 locked

Bit 26 **PLLSAI1ON**: SAI1 PLL enable

Set and cleared by software to enable PLLSAI1.

Cleared by hardware when entering Stop, Standby or Shutdown mode.

0: PLLSAI1 OFF

1: PLLSAI1 ON

Bit 25 **PLL RDY**: Main PLL clock ready flag

Set by hardware to indicate that the main PLL is locked.

0: PLL unlocked

1: PLL locked

Bit 24 **PLLON**: Main PLL enable

Set and cleared by software to enable the main PLL.

Cleared by hardware when entering Stop, Standby or Shutdown mode. This bit cannot be reset if the PLL clock is used as the system clock.

0: PLL OFF

1: PLL ON

Bits 23:20 Reserved, must be kept at reset value.

Bit 19 **CSSON**: Clock security system enable

Set by software to enable the clock security system. When CSSON is set, the clock detector is enabled by hardware when the HSE oscillator is ready, and disabled by hardware if a HSE clock failure is detected. This bit is set only and is cleared by reset.

0: Clock security system OFF (clock detector OFF)

1: Clock security system ON (Clock detector ON if the HSE oscillator is stable, OFF if not).

Bit 18 **HSEBYP**: HSE crystal oscillator bypass

Set and cleared by software to bypass the oscillator with an external clock. The external clock must be enabled with the HSEON bit set, to be used by the device. The HSEBYP bit can be written only if the HSE oscillator is disabled.

0: HSE crystal oscillator not bypassed

1: HSE crystal oscillator bypassed with external clock

Bit 17 **HSERDY**: HSE clock ready flag

Set by hardware to indicate that the HSE oscillator is stable.

0: HSE oscillator not ready

1: HSE oscillator ready

*Note: Once the HSEON bit is cleared, HSERDY goes low after 6 HSE clock cycles.*

Bit 16 **HSEON**: HSE clock enable

Set and cleared by software.

Cleared by hardware to stop the HSE oscillator when entering Stop, Standby or Shutdown mode. This bit cannot be reset if the HSE oscillator is used directly or indirectly as the system clock.

0: HSE oscillator OFF

1: HSE oscillator ON

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **HSIASFS**: HSI16 automatic start from Stop

Set and cleared by software. When the system wakeup clock is MSI, this bit is used to wakeup the HSI16 is parallel of the system wakeup.

0: HSI16 oscillator is not enabled by hardware when exiting Stop mode with MSI as wakeup clock.

1: HSI16 oscillator is enabled by hardware when exiting Stop mode with MSI as wakeup clock.

Bit 10 **HSIRDY**: HSI16 clock ready flag

Set by hardware to indicate that HSI16 oscillator is stable. This bit is set only when HSI16 is enabled by software by setting HSION.

0: HSI16 oscillator not ready

1: HSI16 oscillator ready

*Note: Once the HSION bit is cleared, HSIRDY goes low after 6 HSI16 clock cycles.*

Bit 9 **HSIKERON**: HSI16 always enable for peripheral kernels.

Set and cleared by software to force HSI16 ON even in Stop modes. The HSI16 can only feed USARTs and I<sup>2</sup>Cs peripherals configured with HSI16 as kernel clock. Keeping the HSI16 ON in Stop mode allows to avoid slowing down the communication speed because of the HSI16 startup time. This bit has no effect on HSION value.

0: No effect on HSI16 oscillator.

1: HSI16 oscillator is forced ON even in Stop mode.

Bit 8 **HSION**: HSI16 clock enable

Set and cleared by software.

Cleared by hardware to stop the HSI16 oscillator when entering Stop, Standby or Shutdown mode.

Set by hardware to force the HSI16 oscillator ON when STOPWUCK=1 or HSIASFS = 1 when leaving Stop modes, or in case of failure of the HSE crystal oscillator.

This bit is set by hardware if the HSI16 is used directly or indirectly as system clock.

0: HSI16 oscillator OFF

1: HSI16 oscillator ON

Bits 7:4 **MSIRANGE[3:0]**: MSI clock ranges

These bits are configured by software to choose the frequency range of MSI when MSIRGSEL is set. 12 frequency ranges are available:

0000: range 0 around 100 kHz

0001: range 1 around 200 kHz

0010: range 2 around 400 kHz

0011: range 3 around 800 kHz

0100: range 4 around 1M Hz

0101: range 5 around 2 MHz

0110: range 6 around 4 MHz (reset value)

0111: range 7 around 8 MHz

1000: range 8 around 16 MHz

1001: range 9 around 24 MHz

1010: range 10 around 32 MHz

1011: range 11 around 48 MHz

others: not allowed (hardware write protection)

*Note: Warning: MSIRANGE can be modified when MSI is OFF (MSION=0) or when MSI is ready (MSIRDY=1). MSIRANGE must NOT be modified when MSI is ON and NOT ready (MSION=1 and MSIRDY=0)*

Bit 3 **MSIRGSEL**: MSI clock range selection

Set by software to select the MSI clock range with MSIRANGE[3:0]. Write 0 has no effect.

After a standby or a reset MSIRGSEL is at 0 and the MSI range value is provided by MSIRANGE in CSR register.

0: MSI Range is provided by MSIRANGE[3:0] in RCC\_CSR register

1: MSI Range is provided by MSIRANGE[3:0] in the RCC\_CR register

Bit 2 **MSIPLLEN**: MSI clock PLL enable

Set and cleared by software to enable/ disable the PLL part of the MSI clock source.

MSIPLLEN must be enabled after LSE is enabled (LSEON enabled) and ready (LSERDY set by hardware). There is a hardware protection to avoid enabling MSIPLLEN if LSE is not ready.

This bit is cleared by hardware when LSE is disabled (LSEON = 0) or when the Clock Security System on LSE detects a LSE failure (refer to RCC\_CSR register).

0: MSI PLL OFF

1: MSI PLL ON

Bit 1 **MSIRDY**: MSI clock ready flag

This bit is set by hardware to indicate that the MSI oscillator is stable.

0: MSI oscillator not ready

1: MSI oscillator ready

*Note: Once the MSION bit is cleared, MSIRDY goes low after 6 MSI clock cycles.*

Bit 0 **MSION**: MSI clock enable

This bit is set and cleared by software.

Cleared by hardware to stop the MSI oscillator when entering Stop, Standby or Shutdown mode.

Set by hardware to force the MSI oscillator ON when exiting Standby or Shutdown mode.

Set by hardware to force the MSI oscillator ON when STOPWUCK=0 when exiting from Stop modes, or in case of a failure of the HSE oscillator

Set by hardware when used directly or indirectly as system clock.

0: MSI oscillator OFF

1: MSI oscillator ON

## 6.4.2 Internal clock sources calibration register (RCC\_ICSCR)

Address offset: 0x04

Reset value:

0x10XX 00XX where X is factory-programmed (for STM32L47x/L48x devices).

0x40XX 00XX where X is factory-programmed (for STM32L49x/L4Ax devices).

Access: no wait state, word, half-word and byte access

| 31           | 30           | 29  | 28  | 27  | 26  | 25  | 24  | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|--------------|--------------|-----|-----|-----|-----|-----|-----|-------------|----|----|----|----|----|----|----|
| Res.         | HSITRIM[6:0] |     |     |     |     |     |     | HSICAL[7:0] |    |    |    |    |    |    |    |
|              | r/w          | r/w | r/w | r/w | r/w | r/w | r/w | r           | r  | r  | r  | r  | r  | r  | r  |
| 15           | 14           | 13  | 12  | 11  | 10  | 9   | 8   | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MSITRIM[7:0] |              |     |     |     |     |     |     | MSICAL[7:0] |    |    |    |    |    |    |    |
| r/w          | r/w          | r/w | r/w | r/w | r/w | r/w | r/w | r           | r  | r  | r  | r  | r  | r  | r  |

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **HSITRIM[6:0]**: HSI16 clock trimming (only HSITRIM[4:0] on STM32L47x/L48x)

These bits provide an additional user-programmable trimming value that is added to the HSICAL[7:0] bits. It can be programmed to adjust to variations in voltage and temperature that influence the frequency of the HSI16.

The default value is 16 for STM32L47x/L48x devices and 64 for STM32L49x/L4Ax devices; when added to the HSICAL value, the default HSITRIM value will trim the HSI16 to 16 MHz  $\pm$  1 %.

Bits 23:16 **HSICAL[7:0]**: HSI16 clock calibration

These bits are initialized at startup with the factory-programmed HSI16 calibration trim value. When HSITRIM is written, HSICAL is updated with the sum of HSITRIM and the factory trim value.

Bits 15:8 **MSITRIM[7:0]**: MSI clock trimming

These bits provide an additional user-programmable trimming value that is added to the MSICAL[7:0] bits. It can be programmed to adjust to variations in voltage and temperature that influence the frequency of the MSI.

Bits 7:0 **MSICAL[7:0]**: MSI clock calibration

These bits are initialized at startup with the factory-programmed MSI calibration trim value. When MSITRIM is written, MSICAL is updated with the sum of MSITRIM and the factory trim value.

### 6.4.3 Clock configuration register (RCC\_CFGR)

Address offset: 0x08

Reset value: 0x0000 0000

Access:  $0 \leq \text{wait state} \leq 2$ , word, half-word and byte access

1 or 2 wait states inserted only if the access occurs during clock source switch.

From 0 to 15 wait states inserted if the access occurs when the APB or AHB prescalers values update is on going.

|              |             |            |    |             |            |    |    |           |      |      |      |          |      |         |      |

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **MCOPRE[2:0]**: Microcontroller clock output prescaler

These bits are set and cleared by software.

It is highly recommended to change this prescaler before MCO output is enabled.

000: MCO is divided by 1

001: MCO is divided by 2

010: MCO is divided by 4

011: MCO is divided by 8

100: MCO is divided by 16

Others: not allowed

Bits 27:24 **MCOSEL[3:0]**: Microcontroller clock output (MCOSEL[2:0] only for STM32L47x/L48x devices)

Set and cleared by software.

0000: MCO output disabled, no clock on MCO

0001: SYSCLK system clock selected

0010: MSI clock selected.

0011: HSI16 clock selected.

0100: HSE clock selected

0101: Main PLL clock selected

0110: LSI clock selected

0111: LSE clock selected

1000: Internal HSI48 clock selected (only for STM32L49x/L4Ax devices)

Others: Reserved

*Note: This clock output may have some truncated cycles at startup or during MCO clock source switching.*

Bits 23:16 Reserved, must be kept at reset value.

Bit 15 **STOPWUCK**: Wakeup from Stop and CSS backup clock selection

Set and cleared by software to select the system clock used when exiting Stop mode.

The selected clock is also used as emergency clock for the Clock Security System on HSE.

Warning: STOPWUCK must not be modified when the Clock Security System is enabled by HSECSSON in RCC\_CR register and the system clock is HSE (SWS="10") or a switch on HSE is requested (SW="10").

0: MSI oscillator selected as wakeup from stop clock and CSS backup clock.

1: HSI16 oscillator selected as wakeup from stop clock and CSS backup clock

Bit 14 Reserved, must be kept at reset value.

Bits 13:11 **PPRE2[2:0]**: APB high-speed prescaler (APB2)

Set and cleared by software to control the division factor of the APB2 clock (PCLK2).

0xx: HCLK not divided

100: HCLK divided by 2

101: HCLK divided by 4

110: HCLK divided by 8

111: HCLK divided by 16

Bits 10:8 **PPRE1[2:0]**: APB low-speed prescaler (APB1)

Set and cleared by software to control the division factor of the APB1 clock (PCLK1).

0xx: HCLK not divided

100: HCLK divided by 2

101: HCLK divided by 4

110: HCLK divided by 8

111: HCLK divided by 16

Bits 7:4 **HPRE[3:0]**: AHB prescaler

Set and cleared by software to control the division factor of the AHB clock.

**Caution:** Depending on the device voltage range, the software has to set correctly these bits to ensure that the system frequency does not exceed the maximum allowed frequency (for more details please refer to [Section 5.1.8: Dynamic voltage scaling management](#)). After a write operation to these bits and before decreasing the voltage range, this register must be read to be sure that the new value has been taken into account.

0xxx: SYSCLK not divided

1000: SYSCLK divided by 2

1001: SYSCLK divided by 4

1010: SYSCLK divided by 8

1011: SYSCLK divided by 16

1100: SYSCLK divided by 64

1101: SYSCLK divided by 128

1110: SYSCLK divided by 256

1111: SYSCLK divided by 512

Bits 3:2 **SWS[1:0]**: System clock switch status

Set and cleared by hardware to indicate which clock source is used as system clock.

00: MSI oscillator used as system clock

01: HSI16 oscillator used as system clock

10: HSE used as system clock

11: PLL used as system clock

Bits 1:0 **SW[1:0]**: System clock switch

Set and cleared by software to select system clock source (SYSCLK).

Configured by HW to force MSI oscillator selection when exiting Standby or Shutdown mode.

Configured by HW to force MSI or HSI16 oscillator selection when exiting Stop mode or in case of failure of the HSE oscillator, depending on STOPWUCK value.

00: MSI selected as system clock

01: HSI16 selected as system clock

10: HSE selected as system clock

11: PLL selected as system clock

#### 6.4.4 PLL configuration register (RCC\_PLLCFGR)

Address offset: 0x0C

Reset value: 0x0000 1000

Access: no wait state, word, half-word and byte access

This register is used to configure the PLL clock outputs according to the formulas:

- $f(\text{VCO clock}) = f(\text{PLL clock input}) \times (\text{PLLN} / \text{PLLM})$
- $f(\text{PLL\_P}) = f(\text{VCO clock}) / \text{PLL P}$
- $f(\text{PLL\_Q}) = f(\text{VCO clock}) / \text{PLL Q}$
- $f(\text{PLL\_R}) = f(\text{VCO clock}) / \text{PLL R}$

|              |           |    |    |    |           |    |         |      |           |    |         |      |      |             |         |
|--------------|-----------|----|----|----|-----------|----|---------|------|-----------|----|---------|------|------|-------------|---------|
| 31           | 30        | 29 | 28 | 27 | 26        | 25 | 24      | 23   | 22        | 21 | 20      | 19   | 18   | 17          | 16      |
| PLLPDIV[4:0] |           |    |    |    | PLLR[1:0] |    | PLL REN | Res. | PLLQ[1:0] |    | PLL QEN | Res. | Res. | PLL P       | PLL PEN |
| rw           | rw        | rw | rw | rw | rw        | rw | rw      |      | rw        | rw | rw      |      |      | rw          | rw      |
| 15           | 14        | 13 | 12 | 11 | 10        | 9  | 8       | 7    | 6         | 5  | 4       | 3    | 2    | 1           | 0       |
| Res.         | PLLN[7:0] |    |    |    |           |    |         | Res. | PLLM[2:0] |    |         | Res. | Res. | PLLSRC[1:0] |         |
|              | rw        | rw | rw | rw | rw        | rw | rw      |      | rw        | rw | rw      |      |      | rw          | rw      |

Bits 31:27 **PLLPDIV[4:0]**: Main PLL division factor for PLLSAI2CLK (only for STM32L49x/L4Ax devices)

Set and cleared by software to control the SAI1 or SAI2 clock frequency. PLLSAI3CLK output clock frequency = VCO frequency / PLLPDIV.

00000: PLLSAI3CLK is controlled by the bit PLLP

00001: Reserved.

00010: PLLSAI3CLK = VCO / 2

....

11111: PLLSAI3CLK = VCO / 31

Bits 26:25 **PLL[R1:0]**: Main PLL division factor for PLLCLK (system clock)

Set and cleared by software to control the frequency of the main PLL output clock PLLCLK. This output can be selected as system clock. These bits can be written only if PLL is disabled.

PLLCLK output clock frequency = VCO frequency / PLLR with PLLR = 2, 4, 6, or 8

00: PLLR = 2

01: PLLR = 4

10: PLLR = 6

11: PLLR = 8

**Caution:** The software has to set these bits correctly not to exceed 80 MHz on this domain.

Bit 24 **PLLREN**: Main PLL PLLCLK output enable

Set and reset by software to enable the PLLCLK output of the main PLL (used as system clock).

This bit cannot be written when PLLCLK output of the PLL is used as System Clock.

In order to save power, when the PLLCLK output of the PLL is not used, the value of PLLREN should be 0.

0: PLLCLK output disable

1: PLLCLK output enable

Bit 23 Reserved, must be kept at reset value.

Bits 22:21 **PLLQ[1:0]**: Main PLL division factor for PLL48M1CLK (48 MHz clock).

Set and cleared by software to control the frequency of the main PLL output clock PLL48M1CLK. This output can be selected for USB, RNG, SDMMC (48 MHz clock). These bits can be written only if PLL is disabled.

PLL48M1CLK output clock frequency = VCO frequency / PLLQ with PLLQ = 2, 4, 6, or 8

00: PLLQ = 2

01: PLLQ = 4

10: PLLQ = 6

11: PLLQ = 8

**Caution:** The software has to set these bits correctly not to exceed 80 MHz on this domain.

Bit 20 **PLLQEN**: Main PLL PLL48M1CLK output enable

Set and reset by software to enable the PLL48M1CLK output of the main PLL.

In order to save power, when the PLL48M1CLK output of the PLL is not used, the value of PLLQEN should be 0.

0: PLL48M1CLK output disable

1: PLL48M1CLK output enable

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **PLL[P]**: Main PLL division factor for PLLSAI3CLK (SAI1 and SAI2 clock).

Set and cleared by software to control the frequency of the main PLL output clock PLLSAI3CLK. This output can be selected for SAI1 or SAI2. These bits can be written only if PLL is disabled.

(When the PLLPDIV[4:0] is set to "00000" only for STM32L49x/L4Ax devices) PLLSAI3CLK output clock frequency = VCO frequency / PLLP with PLLP = 7, or 17

0: PLLP = 7

1: PLLP = 17

**Caution:** The software has to set these bits correctly not to exceed 80 MHz on this domain.

Bit 16 **PLLPEN**: Main PLL PLLSAI3CLK output enable

Set and reset by software to enable the PLLSAI3CLK output of the main PLL.

In order to save power, when the PLLSAI3CLK output of the PLL is not used, the value of PLLPEN should be 0.

0: PLLSAI3CLK output disable

1: PLLSAI3CLK output enable

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **PLLN[6:0]**: Main PLL multiplication factor for VCO

Set and cleared by software to control the multiplication factor of the VCO. These bits can be written only when the PLL is disabled.

VCO output frequency = VCO input frequency x PLLN with  $8 \leq \text{PLLN} \leq 86$

0000000: PLLN = 0 wrong configuration

0000001: PLLN = 1 wrong configuration

...

0000111: PLLN = 7 wrong configuration

0001000: PLLN = 8

0001001: PLLN = 9

...

1010101: PLLN = 85

1010110: PLLN = 86

1010111: PLLN = 87 wrong configuration

...

1111111: PLLN = 127 wrong configuration

**Caution:** The software has to set correctly these bits to assure that the VCO output frequency is between 64 and 344 MHz.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **PLLM**: Division factor for the main PLL and audio PLL (PLLSAI1 and PLLSAI2) input clock

Set and cleared by software to divide the PLL, PLLSAI1 and PLLSAI2 input clock before the VCO. These bits can be written only when all PLLs are disabled.

VCO input frequency = PLL input clock frequency / PLLM with  $1 \leq \text{PLLM} \leq 8$

000: PLLM = 1

001: PLLM = 2

010: PLLM = 3

011: PLLM = 4

100: PLLM = 5

101: PLLM = 6

110: PLLM = 7

111: PLLM = 8

**Caution:** The software has to set these bits correctly to ensure that the VCO input frequency ranges from 4 to 16 MHz.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **PLLSRC**: Main PLL, PLLSAI1 and PLLSAI2 entry clock source

Set and cleared by software to select PLL, PLLSAI1 and PLLSAI2 clock source. These bits can be written only when PLL, PLLSAI1 and PLLSAI2 are disabled.

In order to save power, when no PLL is used, the value of PLLSRC should be 00.

00: No clock sent to PLL, PLLSAI1 and PLLSAI2

01: MSI clock selected as PLL, PLLSAI1 and PLLSAI2 clock entry

10: HSI16 clock selected as PLL, PLLSAI1 and PLLSAI2 clock entry

11: HSE clock selected as PLL, PLLSAI1 and PLLSAI2 clock entry

#### 6.4.5 PLLSAI1 configuration register (RCC\_PLLSAI1CFGR)

Address offset: 0x10

Reset value: 0x0000 1000

Access: no wait state, word, half-word and byte access

This register is used to configure the PLLSAI1 clock outputs according to the formulas:

- $f(\text{VCOSAI1 clock}) = f(\text{PLL clock input}) \times (\text{PLLSAI1N} / \text{PLLM})$
- $f(\text{PLLSAI1\_P}) = f(\text{VCOSAI1 clock}) / \text{PLLSAI1P}$
- $f(\text{PLLSAI1\_Q}) = f(\text{VCOSAI1 clock}) / \text{PLLSAI1Q}$
- $f(\text{PLLSAI1\_R}) = f(\text{VCOSAI1 clock}) / \text{PLLSAI1R}$

|                  |               |    |    |    |               |    |                    |      |               |      |                    |      |      |              |                    |

Bits 31:27 **PLLSAI1PDIV[4:0]**: PLLSAI1 division factor for PLLSAI1CLK (only on STM32L49x/L4Ax devices)

Set and cleared by software to control the SAI1 or SAI2 clock frequency. PLLSAI1CLK output clock frequency = VCOSAI1 frequency / PLLPDIV.

00000: PLLSAI1CLK is controlled by the bit PLLP

00001: Reserved.

00010: PLLSAI1CLK = VCOSAI1 / 2

....

11111: PLLSAI1CLK = VCOSAI1 / 31

Bits 26:25 **PLLSAI1R[1:0]**: PLLSAI1 division factor for PLLADC1CLK (ADC clock)

Set and cleared by software to control the frequency of the PLLSAI1 output clock PLLADC1CLK. This output can be selected as ADC clock. These bits can be written only if PLLSAI1 is disabled.

PLLADC1CLK output clock frequency = VCOSAI1 frequency / PLLSAI1R with PLLSAI1R = 2, 4, 6, or 8

00: PLLSAI1R = 2

01: PLLSAI1R = 4

10: PLLSAI1R = 6

11: PLLSAI1R = 8

Bit 24 **PLLSAI1REN**: PLLSAI1 PLLADC1CLK output enable

Set and reset by software to enable the PLLADC1CLK output of the PLLSAI1 (used as clock for ADC).

In order to save power, when the PLLADC1CLK output of the PLLSAI1 is not used, the value of PLLSAI1REN should be 0.

0: PLLADC1CLK output disable

1: PLLADC1CLK output enable

Bit 23 Reserved, must be kept at reset value.

Bits 22:21 **PLLSAI1Q[1:0]**: PLLSAI1 division factor for PLL48M2CLK (48 MHz clock)

Set and cleared by software to control the frequency of the PLLSAI1 output clock PLL48M2CLK. This output can be selected for USB, RNG, SDMMC (48 MHz clock). These bits can be written only if PLLSAI1 is disabled.

PLL48M2CLK output clock frequency = VCOSAI1 frequency / PLLQ with PLLQ = 2, 4, 6, or 8

00: PLLQ = 2

01: PLLQ = 4

10: PLLQ = 6

11: PLLQ = 8

**Caution:** The software has to set these bits correctly not to exceed 80 MHz on this domain.

Bit 20 **PLLSAI1QEN**: PLLSAI1 PLL48M2CLK output enable

Set and reset by software to enable the PLL48M2CLK output of the PLLSAI1.

In order to save power, when the PLL48M2CLK output of the PLLSAI1 is not used, the value of PLLSAI1QEN should be 0.

0: PLL48M2CLK output disable

1: PLL48M2CLK output enable

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **PLLSAI1P**: PLLSAI1 division factor for PLLSAI1CLK (SAI1 or SAI2 clock).

Set and cleared by software to control the frequency of the PLLSAI1 output clock PLLSAI1CLK. This output can be selected for SAI1 or SAI2. These bits can be written only if PLLSAI1 is disabled.

For STM32L49x/L4Ax devices:

If PLLSAI1PDIV[4:0] is set to "00000":

PLLSAI1CLK output clock frequency = VCOSAI1 frequency / PLLSAI1P with  
PLLSAI1P = 7 or 17

If PLLSAI1PDIV[4:0] is different than "00000":

PLLSAI1P has no effect

For STM32L47x/L48x devices:

PLLSAI1CLK output clock frequency = VCOSAI1 frequency / PLLSAI1P with  
PLLSAI1P = 7 or 17

0: PLLSAI1P = 7

1: PLLSAI1P = 17

Bit 16 **PLLSAI1PEN**: PLLSAI1 PLLSAI1CLK output enable

Set and reset by software to enable the PLLSAI1CLK output of the PLLSAI1.

In order to save power, when the PLLSAI1CLK output of the PLLSAI1 is not used, the value of PLLSAI1PEN should be 0.

0: PLLSAI1CLK output disable

1: PLLSAI1CLK output enable

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **PLLSAI1N[6:0]**: PLLSAI1 multiplication factor for VCO

Set and cleared by software to control the multiplication factor of the VCO. These bits can be written only when the PLLSAI1 is disabled.

VCOSAI1 output frequency = VCOSAI1 input frequency x PLLSAI1N

with  $8 \leq \text{PLLSAI1N} \leq 86$

0000000: PLLSAI1N = 0 wrong configuration

0000001: PLLSAI1N = 1 wrong configuration

...

0000111: PLLSAI1N = 7 wrong configuration

0001000: PLLSAI1N = 8

0001001: PLLSAI1N = 9

...

1010101: PLLSAI1N = 85

1010110: PLLSAI1N = 86

1010111: PLLSAI1N = 87 wrong configuration

...

1111111: PLLSAI1N = 127 wrong configuration

**Caution:** The software has to set correctly these bits to ensure that the VCO output frequency is between 64 and 344 MHz.

Bits 7:0 Reserved, must be kept at reset value.

## 6.4.6 PLLSAI2 configuration register (RCC\_PLLSAI2CFGR)

Address offset: 0x14

Reset value: 0x0000 1000

Access: no wait state, word, half-word and byte access

This register is used to configure the PLLSAI2 clock outputs according to the formulas:

- $f(\text{VCOSAI2 clock}) = f(\text{PLL clock input}) \times (\text{PLLSAI2N} / \text{PLLM})$
- $f(\text{PLLSAI2\_P}) = f(\text{VCOSAI2 clock}) / \text{PLLSAI2P}$
- $f(\text{PLLSAI2\_R}) = f(\text{VCOSAI2 clock}) / \text{PLLSAI2R}$

|                  |               |    |    |    |               |    |              |      |      |      |      |      |      |           |              |
|------------------|---------------|----|----|----|---------------|----|--------------|------|------|------|------|------|------|-----------|--------------|

Bits 31:27 **PLLSAI2PDIV[4:0]**: PLLSAI2 division factor for PLLSAI2CLK (only on STM32L49x/L4Ax devices)

Set and cleared by software to control the SAI1 or SAI2 clock frequency. PLLSAI2CLK output clock

frequency = VCOSAI2 frequency / PLLSAI2PDIV.

00000: PLLSAI2CLK is controlled by the bit PLLSAI2P

00001: Reserved.

00010: PLLSAI2CLK = VCOSAI2 / 2

....

11111: PLLSAI2CLK = VCOSAI2 / 31

Bits 26:25 **PLLSAI2R[1:0]**: PLLSAI2 division factor for PLLADC2CLK (ADC clock)

Set and cleared by software to control the frequency of the PLLSAI2 output clock

PLLADC2CLK. This output can be selected as ADC clock. These bits can be written only if PLLSAI2 is disabled.

PLLADC2CLK output clock frequency = VCOSAI2 frequency / PLLSAI2R with PLLSAI2R = 2, 4, 6, or 8

00: PLLSAI2R = 2

01: PLLSAI2R = 4

10: PLLSAI2R = 6

11: PLLSAI2R = 8

Bit 24 **PLLSAI2REN**: PLLSAI2 PLLADC2CLK output enable

Set and reset by software to enable the PLLADC2CLK output of the PLLSAI2 (used as clock for ADC).

In order to save power, when the PLLADC2CLK output of the PLLSAI2 is not used, the value of PLLSAI2REN should be 0.

0: PLLADC2CLK output disable

1: PLLADC2CLK output enable

Bits 23:18 Reserved, must be kept at reset value.

Bit 17 **PLLSAI2P**: PLLSAI2 division factor for PLLSAI2CLK (SAI1 or SAI2 clock).

Set and cleared by software to control the frequency of the PLLSAI2 output clock PLLSAI2CLK. This output can be selected for SAI1 or SAI2. These bits can be written only if PLLSAI2 is disabled.

For STM32L49x/L4Ax devices:

If PLLSAI2PDIV[4:0] is set to "00000":

PLLSAI2CLK output clock frequency = VCOSAI2 frequency / PLLSAI2P with  
PLLSAI2P = 7 or 17

If PLLSAI2PDIV[4:0] is different than "00000":

PLLSAI2P has no effect

For STM32L47x/L48x devices:

PLLSAI2CLK output clock frequency = VCOSAI2 frequency / PLLSAI2P with  
PLLSAI2P = 7 or 17

0: PLLSAI2P = 7

1: PLLSAI2P = 17

Bit 16 **PLLSAI2PEN**: PLLSAI2 PLLSAI2CLK output enable

Set and reset by software to enable the PLLSAI2CLK output of the PLLSAI2.

In order to save power, when the PLLSAI2CLK output of the PLLSAI2 is not used, the value of PLLSAI2PEN should be 0.

0: PLLSAI2CLK output disable

1: PLLSAI2CLK output enable

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **PLLSAI2N[6:0]**: PLLSAI2 multiplication factor for VCO

Set and cleared by software to control the multiplication factor of the VCO. These bits can be written only when the PLLSAI2 is disabled.

VCOSAI2 output frequency = VCOSAI2 input frequency x PLLSAI2N

with  $8 \leq \text{PLLSAI2N} \leq 86$

0000000: PLLSAI2N = 0 wrong configuration

0000001: PLLSAI2N = 1 wrong configuration

...

0000111: PLLSAI2N = 7 wrong configuration

0001000: PLLSAI2N = 8

0001001: PLLSAI2N = 9

...

1010101: PLLSAI2N = 85

1010110: PLLSAI2N = 86

1010111: PLLSAI2N = 87 wrong configuration

...

1111111: PLLSAI2N = 127 wrong configuration

**Caution:** The software has to set correctly these bits to ensure that the VCO output frequency is between 64 and 344 MHz.

Bits 7:0 Reserved, must be kept at reset value.

## 6.4.7 Clock interrupt enable register (RCC\_CIER)

Address offset: 0x18

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

|      |      |      |      |      |             |           |      |                |                |           |           |           |           |           |           |

| 15   | 14   | 13   | 12   | 11   | 10          | 9         | 8    | 7              | 6              | 5         | 4         | 3         | 2         | 1         | 0         |
| Res. | Res. | Res. | Res. | Res. | HSI48 RDYIE | LSE CSSIE | Res. | PLL SAI2 RDYIE | PLL SAI1 RDYIE | PLL RDYIE | HSE RDYIE | HSI RDYIE | MSI RDYIE | LSE RDYIE | LSI RDYIE |
|      |      |      |      |      | rw          | rw        |      | rw             | rw             | rw        | rw        | rw        | rw        | rw        | rw        |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **HSI48RDYIE**: HSI48 ready interrupt enable (only on STM32L49x/L4Ax devices)

Set and cleared by software to enable/disable interrupt caused by the internal HSI48 oscillator.

0: HSI48 ready interrupt disabled

1: HSI48 ready interrupt enabled

Bit 9 **LSECSSIE**: LSE clock security system interrupt enable

Set and cleared by software to enable/disable interrupt caused by the clock security system on LSE.

0: Clock security interrupt caused by LSE clock failure disabled

1: Clock security interrupt caused by LSE clock failure enabled

Bit 8 Reserved, must be kept at reset value.

Bit 7 **PLLSAI2RDYIE**: PLLSAI2 ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by PLLSAI2 lock.

0: PLLSAI2 lock interrupt disabled

1: PLLSAI2 lock interrupt enabled

Bit 6 **PLLSAI1RDYIE**: PLLSAI1 ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by PLLSAI1L lock.

0: PLLSAI1 lock interrupt disabled

1: PLLSAI1 lock interrupt enabled

Bit 5 **PLLRDYIE**: PLL ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by PLL lock.

0: PLL lock interrupt disabled

1: PLL lock interrupt enabled

Bit 4 **HSERDYIE**: HSE ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by the HSE oscillator stabilization.

0: HSE ready interrupt disabled

1: HSE ready interrupt enabled

Bit 3 **HSIRDYIE**: HSI16 ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by the HSI16 oscillator stabilization.

0: HSI16 ready interrupt disabled

1: HSI16 ready interrupt enabled

Bit 2 **MSIRDYIE**: MSI ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by the MSI oscillator stabilization.

0: MSI ready interrupt disabled

1: MSI ready interrupt enabled

Bit 1 **LSERDYIE**: LSE ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by the LSE oscillator stabilization.

0: LSE ready interrupt disabled

1: LSE ready interrupt enabled

Bit 0 **LSIRDYIE**: LSI ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by the LSI oscillator stabilization.

0: LSI ready interrupt disabled

1: LSI ready interrupt enabled

### 6.4.8 Clock interrupt flag register (RCC\_CIFR)

Address offset: 0x1C

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

| 31   | 30   | 29   | 28   | 27   | 26         | 25       | 24   | 23           | 22           | 21       | 20       | 19       | 18       | 17       | 16       |

|      |      |      |      |      | r          | r        | r    | r            | r            | r        | r        | r        | r        | r        | r        |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **HSI48RDYF**: HSI48 ready interrupt flag (only on STM32L49x/L4Ax devices)

Set by hardware when the HSI48 clock becomes stable and HSI48RDYIE is set in a response to setting the HSI48ON (refer to [Clock recovery RC register \(RCC\\_CRRCR\)](#)).

Cleared by software setting the HSI48RDYC bit.

0: No clock ready interrupt caused by the HSI48 oscillator

1: Clock ready interrupt caused by the HSI48 oscillator

Bit 9 **LSECSSF**: LSE Clock security system interrupt flag

Set by hardware when a failure is detected in the LSE oscillator.

Cleared by software setting the LSECSSC bit.

0: No clock security interrupt caused by LSE clock failure

1: Clock security interrupt caused by LSE clock failure

Bit 8 **CSSF**: Clock security system interrupt flag

Set by hardware when a failure is detected in the HSE oscillator.

Cleared by software setting the CSSC bit.

0: No clock security interrupt caused by HSE clock failure

1: Clock security interrupt caused by HSE clock failure

- Bit 7 **PLLSAI2RDYF**: PLLSAI2 ready interrupt flag  
 Set by hardware when the PLLSAI2 locks and PLLSAI2RDYIE is set.  
 Cleared by software setting the PLLSAI2RDYC bit.  
 0: No clock ready interrupt caused by PLLSAI2 lock  
 1: Clock ready interrupt caused by PLLSAI2 lock
- Bit 6 **PLLSAI1RDYF**: PLLSAI1 ready interrupt flag  
 Set by hardware when the PLLSAI1 locks and PLLSAI1RDYIE is set.  
 Cleared by software setting the PLLSAI1RDYC bit.  
 0: No clock ready interrupt caused by PLLSAI1 lock  
 1: Clock ready interrupt caused by PLLSAI1 lock
- Bit 5 **PLLRDYF**: PLL ready interrupt flag  
 Set by hardware when the PLL locks and PLLRDYIE is set.  
 Cleared by software setting the PLLRDYC bit.  
 0: No clock ready interrupt caused by PLL lock  
 1: Clock ready interrupt caused by PLL lock
- Bit 4 **HSERDYF**: HSE ready interrupt flag  
 Set by hardware when the HSE clock becomes stable and HSERDYIE is set.  
 Cleared by software setting the HSERDYC bit.  
 0: No clock ready interrupt caused by the HSE oscillator  
 1: Clock ready interrupt caused by the HSE oscillator
- Bit 3 **HSIRDYF**: HSI16 ready interrupt flag  
 Set by hardware when the HSI16 clock becomes stable and HSIRDYIE is set in a response to setting the HSION (refer to [Clock control register \(RCC\\_CR\)](#)). When HSION is not set but the HSI16 oscillator is enabled by the peripheral through a clock request, this bit is not set and no interrupt is generated.  
 Cleared by software setting the HSIRDYC bit.  
 0: No clock ready interrupt caused by the HSI16 oscillator  
 1: Clock ready interrupt caused by the HSI16 oscillator
- Bit 2 **MSIRDYF**: MSI ready interrupt flag  
 Set by hardware when the MSI clock becomes stable and MSIRDYIE is set.  
 Cleared by software setting the MSIRDYC bit.  
 0: No clock ready interrupt caused by the MSI oscillator  
 1: Clock ready interrupt caused by the MSI oscillator
- Bit 1 **LSERDYF**: LSE ready interrupt flag  
 Set by hardware when the LSE clock becomes stable and LSERDYIE is set.  
 Cleared by software setting the LSERDYC bit.  
 0: No clock ready interrupt caused by the LSE oscillator  
 1: Clock ready interrupt caused by the LSE oscillator
- Bit 0 **LSIRDYF**: LSI ready interrupt flag  
 Set by hardware when the LSI clock becomes stable and LSIRDYIE is set.  
 Cleared by software setting the LSIRDYC bit.  
 0: No clock ready interrupt caused by the LSI oscillator  
 1: Clock ready interrupt caused by the LSI oscillator

#### 6.4.9 Clock interrupt clear register (RCC\_CICR)

Address offset: 0x20

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

|      |      |      |      |      |               |             |      |                 |                     |             |             |             |             |             |             |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **HSI48RDYC**: HSI48 oscillator ready interrupt clear (only on STM32L49x/L4Ax devices)

This bit is set by software to clear the HSI48RDYF flag.

0: No effect

1: Clear the HSI48RDYC flag

Bit 9 **LSECSSC**: LSE Clock security system interrupt clear

This bit is set by software to clear the LSECSSF flag.

0: No effect

1: Clear LSECSSF flag

Bit 8 **CSSC**: Clock security system interrupt clear

This bit is set by software to clear the CSSF flag.

0: No effect

1: Clear CSSF flag

Bit 7 **PLLSAI2RDYC**: PLLSAI2 ready interrupt clear

This bit is set by software to clear the PLLSAI2RDYF flag.

0: No effect

1: Clear PLLSAI2RDYF flag

Bit 6 **PLLSAI1RDYC**: PLLSAI1 ready interrupt clear

This bit is set by software to clear the PLLSAI1RDYF flag.

0: No effect

1: Clear PLLSAI1RDYF flag

Bit 5 **PLLRDYC**: PLL ready interrupt clear

This bit is set by software to clear the PLLRDYF flag.

0: No effect

1: Clear PLLRDYF flag

Bit 4 **HSERDYC**: HSE ready interrupt clear

This bit is set by software to clear the HSERDYF flag.

0: No effect

1: Clear HSERDYF flag

Bit 3 **HSIRDYC**: HSI16 ready interrupt clear

This bit is set software to clear the HSIRDYF flag.

0: No effect

1: Clear HSIRDYF flag

Bit 2 **MSIRDYC**: MSI ready interrupt clear

This bit is set by software to clear the MSIRDYF flag.

0: No effect

1: MSIRDYF cleared

Bit 1 **LSERDYC**: LSE ready interrupt clear

This bit is set by software to clear the LSERDYF flag.

0: No effect

1: LSERDYF cleared

Bit 0 **LSIRDYC**: LSI ready interrupt clear

This bit is set by software to clear the LSIRDYF flag.

0: No effect

1: LSIRDYF cleared

#### 6.4.10 AHB1 peripheral reset register (RCC\_AHB1RSTR)

Address offset: 0x28

Reset value: 0x00000 0000

Access: no wait state, word, half-word and byte access

| 31   | 30   | 29   | 28         | 27   | 26   | 25   | 24           | 23   | 22   | 21   | 20   | 19   | 18   | 17           | 16          |

|      |      |      | rw         |      |      |      | rw           |      |      |      |      |      |      | rw           | rw          |

Bits 31:1817 Reserved, must be kept at reset value.

Bit 17 **DMA2DRST**: DMA2D reset (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: No effect

1: Reset DMA2D

Bit 16 **TSCRST**: Touch Sensing Controller reset

Set and cleared by software.

0: No effect

1: Reset TSC

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **CRCRST**: CRC reset

Set and cleared by software.

0: No effect

1: Reset CRC

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **FLASHRST**: Flash memory interface reset

Set and cleared by software. This bit can be activated only when the Flash memory is in power down mode.

0: No effect

1: Reset Flash memory interface

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **DMA2RST**: DMA2 reset

Set and cleared by software.

0: No effect

1: Reset DMA2

Bit 0 **DMA1RST**: DMA1 reset

Set and cleared by software.

0: No effect

1: Reset DMA1

### 6.4.11 AHB2 peripheral reset register (RCC\_AHB2RSTR)

Address offset: 0x2C

Reset value: 0x00000 0000

Access: no wait state, word, half-word and byte access

| 31   | 30      | 29      | 28         | 27   | 26   | 25   | 24       | 23       | 22       | 21       | 20       | 19       | 18       | 17       | 16       |

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **RNGRST**: Random number generator reset

Set and cleared by software.

0: No effect

1: Reset RNG

Bit 17 **HASHRST**: Hash reset (this bit is reserved for STM32L47x/L48x/L49x devices)

Set and cleared by software.

0: No effect

1: Reset HASH

Bit 16 **AESRST**: AES hardware accelerator reset (this bit is reserved on STM32L47x/L49x devices).

Set and cleared by software.

0: No effect

1: Reset AES

Bit 15 Reserved, must be kept at reset value.

- Bit 14 **DCMIRST**: Digital Camera Interface reset (this bit is reserved for STM32L47x/L48x devices)  
Set and cleared by software  
0: No effect  
1: Reset DCMI interface
- Bit 13 **ADCRST**: ADC reset  
Set and cleared by software.  
0: No effect  
1: Reset ADC interface
- Bit 12 **OTGFSRST**: USB OTG FS reset (this bit is reserved for STM32L471 devices)  
Set and cleared by software.  
0: No effect  
1: Reset USB OTG FS
- Bits 11:9 Reserved, must be kept at reset value.
- Bit 8 **GPIOIRST**: IO port I reset (this bit is reserved for STM32L47x/L48x devices)  
Set and cleared by software  
0: No effect  
1: Reset IO port I
- Bit 7 **GPIOHRST**: IO port H reset  
Set and cleared by software.  
0: No effect  
1: Reset IO port H
- Bit 6 **GPIOGRST**: IO port G reset  
Set and cleared by software.  
0: No effect  
1: Reset IO port G
- Bit 5 **GPIOFRST**: IO port F reset  
Set and cleared by software.  
0: No effect  
1: Reset IO port F
- Bit 4 **GPIOERST**: IO port E reset  
Set and cleared by software.  
0: No effect  
1: Reset IO port E
- Bit 3 **GPIODRST**: IO port D reset  
Set and cleared by software.  
0: No effect  
1: Reset IO port D

- Bit 2 **GPIOCRST**: IO port C reset  
Set and cleared by software.  
0: No effect  
1: Reset IO port C
- Bit 1 **GPIOBRST**: IO port B reset  
Set and cleared by software.  
0: No effect  
1: Reset IO port B
- Bit 0 **GPIOARST**: IO port A reset  
Set and cleared by software.  
0: No effect  
1: Reset IO port A

#### 6.4.12 AHB3 peripheral reset register (RCC\_AHB3RSTR)

Address offset: 0x30

Reset value: 0x00000 0000

Access: no wait state, word, half-word and byte access

|      |      |      |      |      |      |      |             |      |      |      |      |      |      |      |            |

Bits 31:9 Reserved, must be kept at reset value.

- Bit 8 **QSPIRST**: QUADSPI1 memory interface reset  
Set and cleared by software.  
0: No effect  
1: Reset QUADSPI

Bits 7:1 Reserved, must be kept at reset value.

- Bit 0 **FMCRST**: Flexible memory controller reset  
Set and cleared by software.  
0: No effect  
1: Reset FMC

#### 6.4.13 APB1 peripheral reset register 1 (RCC\_APB1RSTR1)

Address offset: 0x38

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

|               |              |             |            |      |             |             |            |             |             |             |              |              |               |               |             |

Bit 31 **LPTIM1RST**: Low Power Timer 1 reset

Set and cleared by software.

0: No effect

1: Reset LPTIM1

Bit 30 **OPAMPRST**: OPAMP interface reset

Set and cleared by software.

0: No effect

1: Reset OPAMP interface

Bit 29 **DAC1RST**: DAC1 interface reset

Set and cleared by software.

0: No effect

1: Reset DAC1 interface

Bit 28 **PWRRST**: Power interface reset

Set and cleared by software.

0: No effect

1: Reset PWR

Bit 27 Reserved, must be kept at reset value.

Bit 26 **CAN2RST**: CAN2 reset (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: No effect

1: Reset CAN2

Bit 25 **CAN1RST**: CAN1 reset

Set and reset by software.

0: No effect

1: Reset the CAN1

Bit 24 **CRSRST**: CRS reset (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software.

0: No effect

1: Reset the CRS

Bit 23 **I2C3RST**: I2C3 reset

Set and reset by software.

0: No effect

1: Reset I2C3

Bit 22 **I2C2RST**: I2C2 reset

Set and cleared by software.

0: No effect

1: Reset I2C2

- Bit 21 **I2C1RST**: I2C1 reset  
Set and cleared by software.  
0: No effect  
1: Reset I2C1
- Bit 20 **UART5RST**: UART5 reset  
Set and cleared by software.  
0: No effect  
1: Reset UART5
- Bit 19 **UART4RST**: UART4 reset  
Set and cleared by software.  
0: No effect  
1: Reset UART4
- Bit 18 **USART3RST**: USART3 reset  
Set and cleared by software.  
0: No effect  
1: Reset USART3
- Bit 17 **USART2RST**: USART2 reset  
Set and cleared by software.  
0: No effect  
1: Reset USART2
- Bit 16 Reserved, must be kept at reset value.
- Bit 15 **SPI3RST**: SPI3 reset  
Set and cleared by software.  
0: No effect  
1: Reset SPI3
- Bit 14 **SPI2RST**: SPI2 reset  
Set and cleared by software.  
0: No effect  
1: Reset SPI2
- Bits 13:10 Reserved, must be kept at reset value.
- Bit 9 **LCDRST**: LCD interface reset (this bit is reserved for STM32L471/L4x5 devices)  
Set and cleared by software.  
0: No effect  
1: Reset LCD
- Bits 8:6 Reserved, must be kept at reset value.
- Bit 5 **TIM7RST**: TIM7 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM7
- Bit 4 **TIM6RST**: TIM6 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM6

- Bit 3 **TIM5RST**: TIM5 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM5
- Bit 2 **TIM4RST**: TIM3 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM3
- Bit 1 **TIM3RST**: TIM3 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM3
- Bit 0 **TIM2RST**: TIM2 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM2

#### 6.4.14 APB1 peripheral reset register 2 (RCC\_APB1RSTR2)

Address offset: 0x3C

Reset value: 0x00000 0000

Access: no wait state, word, half-word and byte access

|      |      |      |      |      |      |      |      |      |      |               |      |      |                   |             |                    |

Bits 31:6 Reserved, must be kept at reset value.

- Bit 5 **LPTIM2RST**: Low-power timer 2 reset  
Set and cleared by software.  
0: No effect  
1: Reset LPTIM2

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **SWPMI1RST**: Single wire protocol reset

Set and cleared by software.

0: No effect

1: Reset SWPMI1

Bit 1 **I2C4RST**: I2C4 reset (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: No effect

1: Reset I2C4

Bit 0 **LPUART1RST**: Low-power UART 1 reset

Set and cleared by software.

0: No effect

1: Reset LPUART1

### 6.4.15 APB2 peripheral reset register (RCC\_APB2RSTR)

Address offset: 0x40

Reset value: 0x00000 0000

Access: no wait state, word, half-word and byte access

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DFSDM1RST**: Digital filters for sigma-delta modulators (DFSDM1) reset

Set and cleared by software.

0: No effect

1: Reset DFSDM1

Bit 23 Reserved, must be kept at reset value.

Bit 22 **SAI2RST**: Serial audio interface 2 (SAI2) reset

Set and cleared by software.

0: No effect

1: Reset SAI2

Bit 21 **SAI1RST**: Serial audio interface 1 (SAI1) reset

Set and cleared by software.

0: No effect

1: Reset SAI1

Bits 20:19 Reserved, must be kept at reset value.

- Bit 18 **TIM17RST**: TIM17 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM17 timer
- Bit 17 **TIM16RST**: TIM16 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM16 timer
- Bit 16 **TIM15RST**: TIM15 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM15 timer
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **USART1RST**: USART1 reset  
Set and cleared by software.  
0: No effect  
1: Reset USART1
- Bit 13 **TIM8RST**: TIM8 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM8 timer
- Bit 12 **SPI1RST**: SPI1 reset  
Set and cleared by software.  
0: No effect  
1: Reset SPI1
- Bit 11 **TIM1RST**: TIM1 timer reset  
Set and cleared by software.  
0: No effect  
1: Reset TIM1 timer
- Bit 10 **SDMMC1RST**: SDMMC reset  
Set and cleared by software.  
0: No effect  
1: Reset SDMMC
- Bits 9:1 Reserved, must be kept at reset value.
- Bit 0 **SYSCFGRST**: SYSCFG + COMP + VREFBUF reset  
0: No effect  
1: Reset SYSCFG + COMP + VREFBUF

#### 6.4.16 AHB1 peripheral clock enable register (RCC\_AHB1ENR)

Address offset: 0x48

Reset value: 0x0000 0100

Access: no wait state, word, half-word and byte access

*Note:* When the peripheral clock is not active, the peripheral registers read or write access is not supported.

|      |      |      |       |      |      |      |             |      |      |      |      |      |      |             |            |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DMA2DEN**: DMA2D clock enable (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: DMA2D clock disabled

1: DMA2D clock enabled

Bit 16 **TSCEN**: Touch Sensing Controller clock enable

Set and cleared by software.

0: TSC clock disable

1: TSC clock enable

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **CRCEN**: CRC clock enable

Set and cleared by software.

0: CRC clock disable

1: CRC clock enable

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **FLASHEN**: Flash memory interface clock enable

Set and cleared by software. This bit can be disabled only when the Flash is in power down mode.

0: Flash memory interface clock disable

1: Flash memory interface clock enable

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **DMA2EN**: DMA2 clock enable

Set and cleared by software.

0: DMA2 clock disable

1: DMA2 clock enable

Bit 0 **DMA1EN**: DMA1 clock enable

Set and cleared by software.

0: DMA1 clock disable

1: DMA1 clock enable

### 6.4.17 AHB2 peripheral clock enable register (RCC\_AHB2ENR)

Address offset: 0x4C

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

**Note:** *When the peripheral clock is not active, the peripheral registers read or write access is not supported.*

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **RNGEN**: Random Number Generator clock enable

Set and cleared by software.

0: Random Number Generator clock disabled

1: Random Number Generator clock enabled

Bit 17 **HASHEN**: HASH clock enable (this bit is reserved for STM32L47x/L48x/L49x devices)

Set and cleared by software

0: HASH clock disabled

1: HASH clock enabled

Bit 16 **AESEN**: AES accelerator clock enable (this bit is reserved on STM32L47x/L49x devices)

Set and cleared by software.

0: AES clock disabled

1: AES clock enabled

Bit 15 Reserved, must be kept at reset value.

Bit 14 **DCMIEN**: DCMI clock enable (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: DCMI clock disabled

1: DCMI clock enabled

Bit 13 **ADCEN**: ADC clock enable

Set and cleared by software.

0: ADC clock disabled

1: ADC clock enabled

Bit 12 **OTGFSEN**: OTG full speed clock enable (this bit is reserved for STM32L471 devices)

Set and cleared by software.

0: USB OTG full speed clock disabled

1: USB OTG full speed clock enabled

Bits 11:9 Reserved, must be kept at reset value.

- Bit 8 **GPIOIEN**: IO port I clock enable (this bit is reserved for STM32L47x/L48x devices)  
Set and cleared by software  
0: IO port I clock disabled  
1: IO port I clock enabled
- Bit 7 **GPIOHEN**: IO port H clock enable  
Set and cleared by software.  
0: IO port H clock disabled  
1: IO port H clock enabled
- Bit 6 **GPIOGEN**: IO port G clock enable  
Set and cleared by software.  
0: IO port G clock disabled  
1: IO port G clock enabled
- Bit 5 **GPIOFEN**: IO port F clock enable  
Set and cleared by software.  
0: IO port F clock disabled  
1: IO port F clock enabled
- Bit 4 **GPIOEEN**: IO port E clock enable  
Set and cleared by software.  
0: IO port E clock disabled  
1: IO port E clock enabled
- Bit 3 **GPIODEN**: IO port D clock enable  
Set and cleared by software.  
0: IO port D clock disabled  
1: IO port D clock enabled
- Bit 2 **GPIOCEN**: IO port C clock enable  
Set and cleared by software.  
0: IO port C clock disabled  
1: IO port C clock enabled
- Bit 1 **GPIOBEN**: IO port B clock enable  
Set and cleared by software.  
0: IO port B clock disabled  
1: IO port B clock enabled
- Bit 0 **GPIOAEN**: IO port A clock enable  
Set and cleared by software.  
0: IO port A clock disabled  
1: IO port A clock enabled

#### 6.4.18 AHB3 peripheral clock enable register(RCC\_AHB3ENR)

Address offset: 0x50

Reset value: 0x00000 0000

Access: no wait state, word, half-word and byte access

*Note:* When the peripheral clock is not active, the peripheral registers read or write access is not supported.

|      |      |      |      |      |      |      |            |      |      |      |      |      |      |      |           |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **QSPIEN**: Quad SPI memory interface clock enable

Set and cleared by software.

0: QUADSPI clock disable

1: QUADSPI clock enable

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **FMCEN**: Flexible memory controller clock enable

Set and cleared by software.

0: FMC clock disable

1: FMC clock enable

#### 6.4.19 APB1 peripheral clock enable register 1 (RCC\_APB1ENR1)

Address: 0x58

Reset value:

0x0000 0000 (for STM32L47x/L48x devices)

0x0000 0400 (for STM32L49x/L4Ax devices)

Access: no wait state, word, half-word and byte access

**Note:** *When the peripheral clock is not active, the peripheral registers read or write access is not supported.*

|              |             |            |           |            |              |            |       |            |            |            |             |             |              |              |            |

- Bit 31 **LPTIM1EN**: Low power timer 1 clock enable  
Set and cleared by software.  
0: LPTIM1 clock disabled  
1: LPTIM1 clock enabled
- Bit 30 **OPAMPEN**: OPAMP interface clock enable  
Set and cleared by software.  
0: OPAMP interface clock disabled  
1: OPAMP interface clock enabled
- Bit 29 **DAC1EN**: DAC1 interface clock enable  
Set and cleared by software.  
0: DAC1 interface clock disabled  
1: DAC1 interface clock enabled
- Bit 28 **PWREN**: Power interface clock enable  
Set and cleared by software.  
0: Power interface clock disabled  
1: Power interface clock enabled
- Bit 27 Reserved, must be kept at reset value.
- Bit 26 **CAN2EN**: CAN2 clock enable (this bit is reserved for STM32L47x/L48x devices)  
Set and cleared by software  
0: CAN2 clock disabled  
1: CAN2 clock enabled
- Bit 25 **CAN1EN**: CAN1 clock enable  
Set and cleared by software.  
0: CAN1 clock disabled  
1: CAN1 clock enabled
- Bit 24 **CRSEN**: Clock Recovery System clock enable (this bit is reserved for STM32L47x/L48x devices)  
Set and cleared by software  
0: CRS clock disabled  
1: CRS clock enabled
- Bit 23 **I2C3EN**: I2C3 clock enable  
Set and cleared by software.  
0: I2C3 clock disabled  
1: I2C3 clock enabled
- Bit 22 **I2C2EN**: I2C2 clock enable  
Set and cleared by software.  
0: I2C2 clock disabled  
1: I2C2 clock enabled
- Bit 21 **I2C1EN**: I2C1 clock enable  
Set and cleared by software.  
0: I2C1 clock disabled  
1: I2C1 clock enabled
- Bit 20 **UART5EN**: UART5 clock enable  
Set and cleared by software.  
0: UART5 clock disabled  
1: UART5 clock enabled

- Bit 19 **UART4EN**: UART4 clock enable  
Set and cleared by software.  
0: UART4 clock disabled  
1: UART4 clock enabled
- Bit 18 **USART3EN**: USART3 clock enable  
Set and cleared by software.  
0: USART3 clock disabled  
1: USART3 clock enabled
- Bit 17 **USART2EN**: USART2 clock enable  
Set and cleared by software.  
0: USART2 clock disabled  
1: USART2 clock enabled
- Bit 16 Reserved, must be kept at reset value.
- Bit 15 **SPI3EN**: SPI3 clock enable  
Set and cleared by software.  
0: SPI3 clock disabled  
1: SPI3 clock enabled
- Bit 14 **SPI2EN**: SPI2 clock enable  
Set and cleared by software.  
0: SPI2 clock disabled  
1: SPI2 clock enabled
- Bits 13:12 Reserved, must be kept at reset value.
- Bit 11 **WWDGEN**: Window watchdog clock enable  
Set by software to enable the window watchdog clock. Reset by hardware system reset.  
This bit can also be set by hardware if the WWDG\_SW option bit is reset.  
0: Window watchdog clock disabled  
1: Window watchdog clock enabled
- Bit 10 **RTCAPBEN**: RTC APB clock enable (this bit is reserved for STM32L47x/L48x devices)  
Set and cleared by software  
0: RTC APB clock disabled  
1: RTC APB clock enabled
- Bit 9 **LCDEN**: LCD clock enable (this bit is reserved for STM32L471/L4x5 devices)  
Set and cleared by software.  
0: LCD clock disabled  
1: LCD clock enabled
- Bits 8:6 Reserved, must be kept at reset value.
- Bit 5 **TIM7EN**: TIM7 timer clock enable  
Set and cleared by software.  
0: TIM7 clock disabled  
1: TIM7 clock enabled
- Bit 4 **TIM6EN**: TIM6 timer clock enable  
Set and cleared by software.  
0: TIM6 clock disabled  
1: TIM6 clock enabled

Bit 3 **TIM5EN**: TIM5 timer clock enable

Set and cleared by software.

0: TIM5 clock disabled

1: TIM5 clock enabled

Bit 2 **TIM4EN**: TIM4 timer clock enable

Set and cleared by software.

0: TIM4 clock disabled

1: TIM4 clock enabled

Bit 1 **TIM3EN**: TIM3 timer clock enable

Set and cleared by software.

0: TIM3 clock disabled

1: TIM3 clock enabled

Bit 0 **TIM2EN**: TIM2 timer clock enable

Set and cleared by software.

0: TIM2 clock disabled

1: TIM2 clock enabled

### 6.4.20 APB1 peripheral clock enable register 2 (RCC\_APB1ENR2)

Address offset: 0x5C

Reset value: 0x00000 0000

Access: no wait state, word, half-word and byte access

**Note:** *When the peripheral clock is not active, the peripheral registers read or write access is not supported.*

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DFSDM1EN**: DFSDM1 timer clock enable

Set and cleared by software.

0: DFSDM1 clock disabled

1: DFSDM1 clock enabled

Bits 23 Reserved, must be kept at reset value.

Bit 22 **SAI2EN**: SAI2 clock enable

Set and cleared by software.

0: SAI2 clock disabled

1: SAI2 clock enabled

Bit 21 **SAI1EN**: SAI1 clock enable

Set and cleared by software.

0: SAI1 clock disabled

1: SAI1 clock enabled

Bits 20:19 Reserved, must be kept at reset value.

Bit 18 **TIM17EN**: TIM17 timer clock enable

Set and cleared by software.

0: TIM17 timer clock disabled

1: TIM17 timer clock enabled

Bit 17 **TIM16EN**: TIM16 timer clock enable

Set and cleared by software.

0: TIM16 timer clock disabled

1: TIM16 timer clock enabled

Bit 16 **TIM15EN**: TIM15 timer clock enable

Set and cleared by software.

0: TIM15 timer clock disabled

1: TIM15 timer clock enabled

Bit 15 Reserved, must be kept at reset value.

- Bit 14 **USART1EN**: USART1 clock enable  
Set and cleared by software.  
0: USART1 clock disabled  
1: USART1 clock enabled
- Bit 13 **TIM8EN**: TIM8 timer clock enable  
Set and cleared by software.  
0: TIM8 timer clock disabled  
1: TIM8 timer clock enabled
- Bit 12 **SPI1EN**: SPI1 clock enable  
Set and cleared by software.  
0: SPI1 clock disabled  
1: SPI1 clock enabled
- Bit 11 **TIM1EN**: TIM1 timer clock enable  
Set and cleared by software.  
0: TIM1 timer clock disabled  
1: TIM1P timer clock enabled
- Bit 10 **SDMMC1EN**: SDMMC clock enable  
Set and cleared by software.  
0: SDMMC clock disabled  
1: SDMMC clock enabled
- Bits 9:8 Reserved, must be kept at reset value.
- Bit 7 **FWEN**: Firewall clock enable  
Set by software, reset by hardware. Software can only write 1. A write at 0 has no effect.  
0: Firewall clock disabled  
1: Firewall clock enabled
- Bits 6:1 Reserved, must be kept at reset value.
- Bit 0 **SYSCFGEN**: SYSCFG + COMP + VREFBUF clock enable  
Set and cleared by software.  
0: SYSCFG + COMP + VREFBUF clock disabled  
1: SYSCFG + COMP + VREFBUF clock enabled

#### 6.4.22 AHB1 peripheral clocks enable in Sleep and Stop modes register (RCC\_AHB1SMENR)

Address offset: 0x68

Reset value:

0x0001 1303 (for STM32L47x/L48x devices)

0x0003 1303 (for STM32L49x/L4Ax devices)

Access: no wait state, word, half-word and byte access

|      |      |      |         |      |      |            |            |      |      |      |      |      |      |            |           |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DMA2DSMEN**: DMA2D clock enable during Sleep and Stop modes (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: DMA2D clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: DMA2D clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 16 **TSCSMEN**: Touch Sensing Controller clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TSC clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TSC clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **CRCSMEN**: CRC clocks enable during Sleep and Stop modes

Set and cleared by software.

0: CRC clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: CRC clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **SRAM1SMEN**: SRAM1 interface clocks enable during Sleep and Stop modes

Set and cleared by software.

0: SRAM1 interface clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: SRAM1 interface clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 8 **FLASHSMEN**: Flash memory interface clocks enable during Sleep and Stop modes

Set and cleared by software.

0: Flash memory interface clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: Flash memory interface clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **DMA2SMEN**: DMA2 clocks enable during Sleep and Stop modes

Set and cleared by software during Sleep mode.

0: DMA2 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: DMA2 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 0 **DMA1SMEN**: DMA1 clocks enable during Sleep and Stop modes

Set and cleared by software.

0: DMA1 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: DMA1 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1. This register only configures the clock gating, not the clock source itself. Most of the peripherals are clocked by a single clock (AHB or APB clock), which is always disabled in Stop mode. In this case setting the bit has no effect in Stop mode.

### 6.4.23 AHB2 peripheral clocks enable in Sleep and Stop modes register (RCC\_AHB2SMENR)

Address offset: 0x6C

Reset value:

0x0005 32FF (for STM32L47x/L48x devices)

0x0007 73FF (for STM32L49x/L4Ax devices)

Access: no wait state, word, half-word and byte access

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **RNGSMEN**: Random Number Generator clocks enable during Sleep and Stop modes

Set and cleared by software.

0: Random Number Generator clocks disabled by the clock gating during Sleep and Stop modes

1: Random Number Generator clocks enabled by the clock gating during Sleep and Stop modes

Bit 17 **HASHSMEN**: HASH clock enable during Sleep and Stop modes (this bit is reserved for STM32L47x/L48x/L49x devices)

Set and cleared by software

0: HASH clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: HASH clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 16 **AESSMEN**: AES accelerator clocks enable during Sleep and Stop modes (this bit is reserved on STM32L47x/L49x devices)

Set and cleared by software.

0: AES clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: AES clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 15 Reserved, must be kept at reset value.

Bit 14 **DCMISMEN**: DCMI clock enable during Sleep and Stop modes (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: DCMI clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: DCMI clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 13 **ADCSMEN**: ADC clocks enable during Sleep and Stop modes

Set and cleared by software.

0: ADC clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: ADC clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 12 **OTGFSSMEN**: OTG full speed clocks enable during Sleep and Stop modes (this bit is reserved for STM32L471 devices)

Set and cleared by software.

0: USB OTG full speed clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: USB OTG full speed clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **SRAM2SMEN**: SRAM2 interface clocks enable during Sleep and Stop modes

Set and cleared by software.

0: SRAM2 interface clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: SRAM2 interface clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 8 **GPIOISMEN**: IO port I clocks enable during Sleep and Stop modes (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: IO port I clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port I clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 7 **GPIOHSMEN**: IO port H clocks enable during Sleep and Stop modes

Set and cleared by software.

0: IO port H clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port H clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 6 **GPIOGSMEN**: IO port G clocks enable during Sleep and Stop modes

Set and cleared by software.

0: IO port G clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port G clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 5 **GPIOFSMEN**: IO port F clocks enable during Sleep and Stop modes

Set and cleared by software.

0: IO port F clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port F clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 4 **GPIOESMEN**: IO port E clocks enable during Sleep and Stop modes

Set and cleared by software.

0: IO port E clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port E clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 3 **GPIODSMEN**: IO port D clocks enable during Sleep and Stop modes

Set and cleared by software.

0: IO port D clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port D clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 2 **GPIOCSMEN**: IO port C clocks enable during Sleep and Stop modes

Set and cleared by software.

0: IO port C clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port C clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 1 **GPIOBSMEN**: IO port B clocks enable during Sleep and Stop modes

Set and cleared by software.

0: IO port B clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port B clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 0 **GPIOASMEN**: IO port A clocks enable during Sleep and Stop modes

Set and cleared by software.

0: IO port A clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: IO port A clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1. This register only configures the clock gating, not the clock source itself. Most of the peripherals are clocked by a single clock (AHB or APB clock), which is always disabled in Stop mode. In this case setting the bit has no effect in Stop mode.

#### 6.4.24 AHB3 peripheral clocks enable in Sleep and Stop modes register (RCC\_AHB3SMENR)

Address offset: 0x70

Reset value: 0x00000 0101

Access: no wait state, word, half-word and byte access

|      |      |      |      |      |      |      |              |      |      |      |      |      |      |      |             |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **QSPISMEN** Quad SPI memory interface clocks enable during Sleep and Stop modes

Set and cleared by software.

0: QUADSPI clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: QUADSPI clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **FMCSMEN**: Flexible memory controller clocks enable during Sleep and Stop modes

Set and cleared by software.

0: FMC clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: FMC clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1. This register only configures the clock gating, not the clock source itself. Most of the peripherals are clocked by a single clock (AHB or APB clock), which is always disabled in Stop mode. In this case setting the bit has no effect in Stop mode.

#### 6.4.25 APB1 peripheral clocks enable in Sleep and Stop modes register 1 (RCC\_APB1SMENR1)

Address: 0x78

Reset value:

0xF2FE CA3F (for STM32L47x/L48x devices)

0xF7FE CE3F (for STM32L49x/L4Ax devices)

Access: no wait state, word, half-word and byte access

Bit 31 **LPTIM1SMEN**: Low power timer 1 clocks enable during Sleep and Stop modes

Set and cleared by software.

0: LPTIM1 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: LPTIM1 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 30 **OPAMP SMEN**: OPAMP interface clocks enable during Sleep and Stop modes

Set and cleared by software.

0: OPAMP interface clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: OPAMP interface clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 29 **DAC1SMEN**: DAC1 interface clocks enable during Sleep and Stop modes

Set and cleared by software.

0: DAC1 interface clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: DAC1 interface clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 28 **PWR SMEN**: Power interface clocks enable during Sleep and Stop modes

Set and cleared by software.

0: Power interface clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: Power interface clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 27 Reserved, must be kept at reset value.

Bit 26 **CAN2SMEN**: CAN2 clocks enable during Sleep and Stop modes (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: CAN2 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: CAN2 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 25 **CAN1SMEN**: CAN1 clocks enable during Sleep and Stop modes

Set and cleared by software.

0: CAN1 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: CAN1 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 24 **CRSSMEN**: CRS clock enable during Sleep and Stop modes (this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software.

0: CRS clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: CRS clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

- Bit 23 **I2C3SMEN**: I2C3 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: I2C3 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: I2C3 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bit 22 **I2C2SMEN**: I2C2 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: I2C2 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: I2C2 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bit 21 **I2C1SMEN**: I2C1 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: I2C1 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: I2C1 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bit 20 **UART5SMEN**: UART5 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: UART5 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: UART5 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bit 19 **UART4SMEN**: UART4 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: UART4 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: UART4 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bit 18 **USART3SMEN**: USART3 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: USART3 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: USART3 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bit 17 **USART2SMEN**: USART2 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: USART2 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: USART2 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bit 16 Reserved, must be kept at reset value.
- Bit 15 **SPI3SMEN**: SPI3 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: SPI3 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: SPI3 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bit 14 **SPI2SMEN**: SPI2 clocks enable during Sleep and Stop modes  
 Set and cleared by software.  
 0: SPI2 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: SPI2 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes
- Bits 13:12 Reserved, must be kept at reset value.
- Bit 11 **WWDGSMEN**: Window watchdog clocks enable during Sleep and Stop modes  
 Set and cleared by software. This bit is forced to '1' by hardware when the hardware WWDG option is activated.  
 0: Window watchdog clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes  
 1: Window watchdog clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 10 **RTCAPBSMEN**: RTC APB clock enable during Sleep and Stop modes

(this bit is reserved for STM32L47x/L48x devices)

Set and cleared by software

0: RTC APB clock disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: RTC APB clock enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 9 **LCDSMEN**: LCD clocks enable during Sleep and Stop modes (this bit is reserved for STM32L471/L4x5 devices)

Set and cleared by software.

0: LCD clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: LCD clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bits 8:6 Reserved, must be kept at reset value.

Bit 5 **TIM7SMEN**: TIM7 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM7 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM7 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 4 **TIM6SMEN**: TIM6 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM6 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM6 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 3 **TIM5SMEN**: TIM5 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM5 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM5 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 2 **TIM4SMEN**: TIM4 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM4 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM4 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 1 **TIM3SMEN**: TIM3 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM3 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM3 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 0 **TIM2SMEN**: TIM2 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM2 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM2 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1. This register only configures the clock gating, not the clock source itself. Most of the peripherals are clocked by a single clock (AHB or APB clock), which is always disabled in Stop mode. In this case setting the bit has no effect in Stop mode.

#### 6.4.26 APB1 peripheral clocks enable in Sleep and Stop modes register 2 (RCC\_APB1SMENR2)

Address offset: 0x7C

Reset value:

0x0000 0025 (for STM32L47x/L48x devices)

0x0000 0027 (for STM32L49x/L4Ax devices)

Access: no wait state, word, half-word and byte access

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DFSDM1SMEN**: DFSDM1 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: DFSDM1 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: DFSDM1 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 23 Reserved, must be kept at reset value.

Bit 22 **SAI2SMEN**: SAI2 clocks enable during Sleep and Stop modes

Set and cleared by software.

0: SAI2 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: SAI2 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 21 **SAI1SMEN**: SAI1 clocks enable during Sleep and Stop modes

Set and cleared by software.

0: SAI1 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: SAI1 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bits 20:19 Reserved, must be kept at reset value.

Bit 18 **TIM17SMEN**: TIM17 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM17 timer clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM17 timer clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 17 **TIM16SMEN**: TIM16 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM16 timer clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM16 timer clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 16 **TIM15SMEN**: TIM15 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM15 timer clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM15 timer clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 15 Reserved, must be kept at reset value.

Bit 14 **USART1SMEN**: USART1 clocks enable during Sleep and Stop modes

Set and cleared by software.

0: USART1 clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: USART1 clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 13 **TIM8SMEN**: TIM8 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM8 timer clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM8 timer clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 12 **SPI1SMEN**: SPI1 clocks enable during Sleep and Stop modes

Set and cleared by software.

0: SPI1 clocks disabled by the clock gating during<sup>(1)</sup> Sleep and Stop modes

1: SPI1 clocks enabled by the clock gating during<sup>(1)</sup> Sleep and Stop modes

Bit 11 **TIM1SMEN**: TIM1 timer clocks enable during Sleep and Stop modes

Set and cleared by software.

0: TIM1 timer clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: TIM1P timer clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bit 10 **SDMMC1SMEN**: SDMMC clocks enable during Sleep and Stop modes

Set and cleared by software.

0: SDMMC clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: SDMMC clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

Bits 9:1 Reserved, must be kept at reset value.

Bit 0 **SYSCFGSMEN**: SYSCFG + COMP + VREFBUF clocks enable during Sleep and Stop modes

Set and cleared by software.

0: SYSCFG + COMP + VREFBUF clocks disabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1: SYSCFG + COMP + VREFBUF clocks enabled by the clock gating<sup>(1)</sup> during Sleep and Stop modes

1. This register only configures the clock gating, not the clock source itself. Most of the peripherals are clocked by a single clock (AHB or APB clock), which is always disabled in Stop mode. In this case setting the bit has no effect in Stop mode.

## 6.4.28 Peripherals independent clock configuration register (RCC\_CCIPR)

Address: 0x88

Reset value: 0x0000 0000

Access: no wait states, word, half-word and byte access

|              |           |              |    |                 |    |               |    |               |    |                |    |                |    |                |    |

**Bit 31 DFSDM1SEL:** DFSDM1 clock source selection

This bit is set and cleared by software to select the DFSDM1 clock source.

0: APB2 (PCLK2) selected as DFSDM1 clock

1: System clock (SYSCLK) used as DFSDM1 clock

**Bit 30 SWPMI1SEL:** SWPMI1 clock source selection

This bit is set and cleared by software to select the SWPMI1 clock source.

0: APB1 (PCLK1) selected as SWPMI1 clock

1: HSI16 clock selected as SWPMI1 clock

**Bits 29:28 ADCSEL[1:0]:** ADCs clock source selection

These bits are set and cleared by software to select the clock source used by the ADC interface.

00: No clock selected

01: PLLSAI1 "R" clock (PLLADC1CLK) selected as ADCs clock

10: PLLSAI2 "R" clock (PLLADC2CLK) selected as ADCs clock

11: System clock selected as ADCs clock

**Bits 27:26 CLK48SEL[1:0]:** 48 MHz clock source selection

These bits are set and cleared by software to select the 48 MHz clock source used by USB OTG FS, RNG and SDMMC.

00: HSI48 clock selected as 48 MHz clock (only for STM32L49x/L4Ax devices, otherwise no clock selected)

01: PLLSAI1 "Q" clock (PLL48M2CLK) selected as 48 MHz clock

10: PLL "Q" clock (PLL48M1CLK) selected as 48 MHz clock

11: MSI clock selected as 48 MHz clock

**Bits 25:24 SAI2SEL[1:0]:** SAI2 clock source selection

These bits are set and cleared by software to select the SAI2 clock source.

00: PLLSAI1 "P" clock (PLLSAI1CLK) selected as SAI2 clock

01: PLLSAI2 "P" clock (PLLSAI2CLK) selected as SAI2 clock

10: PLL "P" clock (PLLSAI3CLK) selected as SAI2 clock

11: External input SAI2\_EXTCLK selected as SAI2 clock

**Caution:** If the selected clock is the external clock, it is not possible to switch to another clock if the external clock is not present.

**Bits 23:22 SAI1SEL[1:0]:** SAI1 clock source selection

These bits are set and cleared by software to select the SAI1 clock source.

00: PLLSAI1 "P" clock (PLLSAI1CLK) selected as SAI1 clock

01: PLLSAI2 "P" clock (PLLSAI2CLK) selected as SAI1 clock

10: PLL "P" clock (PLLSAI3CLK) selected as SAI1 clock

11: External input SAI1\_EXTCLK selected as SAI1 clock

**Caution:** If the selected clock is the external clock, it is not possible to switch to another clock if the external clock is not present.

**Bits 21:20 LPTIM2SEL[1:0]:** Low power timer 2 clock source selection

These bits are set and cleared by software to select the LPTIM2 clock source.

00: PCLK selected as LPTIM2 clock

01: LSI clock selected as LPTIM2 clock

10: HSI16 clock selected as LPTIM2 clock

11: LSE clock selected as LPTIM2 clock

Bits 19:18 **LPTIM1SEL[1:0]**: Low power timer 1 clock source selection

These bits are set and cleared by software to select the LPTIM1 clock source.

- 00: PCLK selected as LPTIM1 clock
- 01: LSI clock selected as LPTIM1 clock
- 10: HSI16 clock selected as LPTIM1 clock
- 11: LSE clock selected as LPTIM1 clock

Bits 17:16 **I2C3SEL[1:0]**: I2C3 clock source selection

These bits are set and cleared by software to select the I2C3 clock source.

- 00: PCLK selected as I2C3 clock
- 01: System clock (SYSCLK) selected as I2C3 clock
- 10: HSI16 clock selected as I2C3 clock
- 11: Reserved

Bits 15:14 **I2C2SEL[1:0]**: I2C2 clock source selection

These bits are set and cleared by software to select the I2C2 clock source.

- 00: PCLK selected as I2C2 clock
- 01: System clock (SYSCLK) selected as I2C2 clock
- 10: HSI16 clock selected as I2C2 clock
- 11: Reserved

Bits 13:12 **I2C1SEL[1:0]**: I2C1 clock source selection

These bits are set and cleared by software to select the I2C1 clock source.

- 00: PCLK selected as I2C1 clock
- 01: System clock (SYSCLK) selected as I2C1 clock
- 10: HSI16 clock selected as I2C1 clock
- 11: Reserved

Bits 11:10 **LPUART1SEL[1:0]**: LPUART1 clock source selection

These bits are set and cleared by software to select the LPUART1 clock source.

- 00: PCLK selected as LPUART1 clock
- 01: System clock (SYSCLK) selected as LPUART1 clock
- 10: HSI16 clock selected as LPUART1 clock
- 11: LSE clock selected as LPUART1 clock

Bits 9:8 **UART5SEL[1:0]**: UART5 clock source selection

These bits are set and cleared by software to select the UART5 clock source.

- 00: PCLK selected as UART5 clock
- 01: System clock (SYSCLK) selected as UART5 clock
- 10: HSI16 clock selected as UART5 clock
- 11: LSE clock selected as UART5 clock

Bits 7:6 **UART4SEL[1:0]**: UART4 clock source selection

This bit is set and cleared by software to select the UART4 clock source.

- 00: PCLK selected as UART4 clock
- 01: System clock (SYSCLK) selected as UART4 clock
- 10: HSI16 clock selected as UART4 clock
- 11: LSE clock selected as UART4 clock

Bits 5:4 **USART3SEL[1:0]**: USART3 clock source selection

This bit is set and cleared by software to select the USART3 clock source.

00: PCLK selected as USART3 clock

01: System clock (SYSCLK) selected as USART3 clock

10: HSI16 clock selected as USART3 clock

11: LSE clock selected as USART3 clock

Bits 3:2 **USART2SEL[1:0]**: USART2 clock source selection

This bit is set and cleared by software to select the USART2 clock source.

00: PCLK selected as USART2 clock

01: System clock (SYSCLK) selected as USART2 clock

10: HSI16 clock selected as USART2 clock

11: LSE clock selected as USART2 clock

Bits 1:0 **USART1SEL[1:0]**: USART1 clock source selection

This bit is set and cleared by software to select the USART1 clock source.

00: PCLK selected as USART1 clock

01: System clock (SYSCLK) selected as USART1 clock

10: HSI16 clock selected as USART1 clock

11: LSE clock selected as USART1 clock

#### 6.4.29 Backup domain control register (RCC\_BDCR)

Address offset: 0x90

Reset value: 0x0000 0000, reset by Backup domain Reset, except LSCOSEL, LSCOEN and BDRST which are reset only by Backup domain power-on reset.

Access:  $0 \leq \text{wait state} \leq 3$ , word, half-word and byte access

Wait states are inserted in case of successive accesses to this register.

**Note:** The bits of the [Backup domain control register \(RCC\\_BDCR\)](#) are outside of the  $V_{\text{CORE}}$  domain. As a result, after Reset, these bits are write-protected and the DBP bit in the [Section 5.4.1: Power control register 1 \(PWR\\_CR1\)](#) has to be set before these can be modified. Refer to [Section 5.1.5: Battery backup domain on page 156](#) for further information. These bits (except LSCOSEL, LSCOEN and BDRST) are only reset after a Backup domain Reset (see [Section 6.1.3: Backup domain reset](#)). Any internal or external Reset will not have any effect on these bits.

|           |      |      |      |      |      |             |            |             |              |             |            |            |       |      |       |

| RTC<br>EN | Res. | Res. | Res. | Res. | Res. | RTCSEL[1:0] | Res.       | LSE<br>CSSD | LSE<br>CSSON | LSEDRV[1:0] | LSE<br>BYP | LSE<br>RDY | LSEON |      |       |
| rw        |      |      |      |      |      | rw          | rw         | r           | rw           | rw          | rw         | rw         | r     |      | rw    |

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **LSCOSEL**: Low speed clock output selection

Set and cleared by software.

0: LSI clock selected

1: LSE clock selected

Bit 24 **LSCOEN**: Low speed clock output enable

Set and cleared by software.

0: Low speed clock output (LSCO) disable

1: Low speed clock output (LSCO) enable

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **BDRST**: Backup domain software reset

Set and cleared by software.

0: Reset not activated

1: Reset the entire Backup domain

Bit 15 **RTCEN**: RTC clock enable

Set and cleared by software.

0: RTC clock disabled

1: RTC clock enabled

Bits 14:10 Reserved, must be kept at reset value.

Bits 9:8 **RTCSEL[1:0]**: RTC clock source selection

Set by software to select the clock source for the RTC. Once the RTC clock source has been selected, it cannot be changed anymore unless the Backup domain is reset, or unless a failure is detected on LSE (LSECSSD is set). The BDRST bit can be used to reset them.

00: No clock

01: LSE oscillator clock used as RTC clock

10: LSI oscillator clock used as RTC clock

11: HSE oscillator clock divided by 32 used as RTC clock

Bit 7 Reserved, must be kept at reset value.

Bit 6 **LSECSSD** CSS on LSE failure Detection

Set by hardware to indicate when a failure has been detected by the Clock Security System on the external 32 kHz oscillator (LSE).

0: No failure detected on LSE (32 kHz oscillator)

1: Failure detected on LSE (32 kHz oscillator)

Bit 5 **LSECSSON** CSS on LSE enable

Set by software to enable the Clock Security System on LSE (32 kHz oscillator).

LSECSSON must be enabled after the LSE oscillator is enabled (LSEON bit enabled) and ready (LSERDY flag set by hardware), and after the RTCSEL bit is selected.

Once enabled this bit cannot be disabled, except after a LSE failure detection (LSECSSD =1). In that case the software MUST disable the LSECSSON bit.

0: CSS on LSE (32 kHz external oscillator) OFF

1: CSS on LSE (32 kHz external oscillator) ON

Bits 4:3 **LSEDRV[1:0]** LSE oscillator drive capability

Set by software to modulate the LSE oscillator's drive capability.

00: 'Xtal mode' lower driving capability

01: 'Xtal mode' medium low driving capability

10: 'Xtal mode' medium high driving capability

11: 'Xtal mode' higher driving capability

The oscillator is in Xtal mode when it is not in bypass mode.

Bit 2 **LSEBYP**: LSE oscillator bypass

Set and cleared by software to bypass oscillator in debug mode. This bit can be written only when the external 32 kHz oscillator is disabled (LSEON=0 and LSEBYP=0).

0: LSE oscillator not bypassed

1: LSE oscillator bypassed

Bit 1 **LSERDY**: LSE oscillator ready

Set and cleared by hardware to indicate when the external 32 kHz oscillator is stable. After the LSEON bit is cleared, LSERDY goes low after 6 external low-speed oscillator clock cycles.

0: LSE oscillator not ready

1: LSE oscillator ready

Bit 0 **LSEON**: LSE oscillator enable

Set and cleared by software.

0: LSE oscillator OFF

1: LSE oscillator ON

### 6.4.30 Control/status register (RCC\_CSR)

Address: 0x94

Reset value: 0x0C00 0600, reset by system Reset, except reset flags by power Reset only.

Access: 0 ≤ wait state ≤ 3, word, half-word and byte access

Wait states are inserted in case of successive accesses to this register.

| 31           | 30           | 29           | 28          | 27             | 26          | 25          | 24         | 23   | 22   | 21   | 20   | 19   | 18   | 17         | 16    |

|              |              |              |             | rw             | rw          | rw          | rw         |      |      |      |      |      |      | r          | rw    |

- Bit 31 **LPWRRSTF**: Low-power reset flag  
Set by hardware when a reset occurs due to illegal Stop, Standby or Shutdown mode entry.  
Cleared by writing to the RMVF bit.  
0: No illegal mode reset occurred  
1: Illegal mode reset occurred
- Bit 30 **WWDGRSTF**: Window watchdog reset flag  
Set by hardware when a window watchdog reset occurs.  
Cleared by writing to the RMVF bit.  
0: No window watchdog reset occurred  
1: Window watchdog reset occurred
- Bit 29 **IWDGRSTF**: Independent window watchdog reset flag  
Set by hardware when an independent watchdog reset domain occurs.  
Cleared by writing to the RMVF bit.  
0: No independent watchdog reset occurred  
1: Independent watchdog reset occurred
- Bit 28 **SFTRSTF**: Software reset flag  
Set by hardware when a software reset occurs.  
Cleared by writing to the RMVF bit.  
0: No software reset occurred  
1: Software reset occurred
- Bit 27 **BORRSTF**: BOR flag  
Set by hardware when a BOR occurs.  
Cleared by writing to the RMVF bit.  
0: No BOR occurred  
1: BOR occurred
- Bit 26 **PINRSTF**: Pin reset flag  
Set by hardware when a reset from the NRST pin occurs.  
Cleared by writing to the RMVF bit.  
0: No reset from NRST pin occurred  
1: Reset from NRST pin occurred
- Bit 25 **OBLRSTF**: Option byte loader reset flag  
Set by hardware when a reset from the Option Byte loading occurs.  
Cleared by writing to the RMVF bit.  
0: No reset from Option Byte loading occurred  
1: Reset from Option Byte loading occurred
- Bit 24 **FWRSTF**: Firewall reset flag  
Set by hardware when a reset from the firewall occurs.  
Cleared by writing to the RMVF bit.  
0: No reset from the firewall occurred  
1: Reset from the firewall occurred
- Bit 23 **RMVF**: Remove reset flag  
Set by software to clear the reset flags.  
0: No effect  
1: Clear the reset flags
- Bits 22:12 Reserved, must be kept at reset value.

Bits 11:8 **MSISRANGE[3:0]** MSI range after Standby mode

Set by software to choose the MSI frequency at startup. This range is used after exiting Standby mode until MSIRGSEL is set. After a pad or a power-on reset, the range is always 4 MHz. MSISRANGE can be written only when MSIRGSEL = '1'.

0100: Range 4 around 1 MHz

0101: Range 5 around 2 MHz

0110: Range 6 around 4 MHz (reset value)

0111: Range 7 around 8 MHz

others: Reserved

*Note: Changing the MSISRANGE does not change the current MSI frequency.*

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **LSIRDY**: LSI oscillator ready

Set and cleared by hardware to indicate when the LSI oscillator is stable. After the LSION bit is cleared, LSIRDY goes low after 3 LSI oscillator clock cycles. This bit can be set even if LSION = 0 if the LSI is requested by the Clock Security System on LSE, by the Independent Watchdog or by the RTC.

0: LSI oscillator not ready

1: LSI oscillator ready

Bit 0 **LSION**: LSI oscillator enable

Set and cleared by software.

0: LSI oscillator OFF

1: LSI oscillator ON

### 6.4.31 Clock recovery RC register (RCC\_CRRCR)<sup>(a)</sup>

Address: 0x98

Reset value: 0x0000 XXX0 where X is factory-programmed.

Access: no wait state, word, half-word and byte access

|               |      |      |      |      |      |      |      |      |      |      |      |      |      |           |          |

Bits 31:16 Reserved, must be kept at reset value

Bits 15:7 **HSI48CAL[8:0]**: HSI48 clock calibration

These bits are initialized at startup with the factory-programmed HSI48 calibration trim value. They are ready only.

a. Register is present on L496/L4A6 devices only.

Bits 6:2 Reserved, must be kept at reset value

Bit 1 **HSI48RDY**: HSI48 clock ready flag

Set by hardware to indicate that HSI48 oscillator is stable. This bit is set only when HSI48 is enabled by software by setting HSI48ON.

0: HSI48 oscillator not ready

1: HSI48 oscillator ready

Bit 0 **HSI48ON**: HSI48 clock enable

Set and cleared by software.

Cleared by hardware to stop the HSI48 when entering in Stop, Standby or Shutdown modes.

0: HSI48 oscillator OFF

1: HSI48 oscillator ON

### 6.4.32 Peripherals independent clock configuration register (RCC\_CCIPR2)<sup>(a)</sup>

Address: 0x9C

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

Wait states are inserted in case of successive accesses to this register.

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **I2C4SEL[1:0]**: I2C4 clock source selection

These bits are set and cleared by software to select the I2C4 clock source.

00: PCLK selected as I2C4 clock

01: System clock (SYSCLK) selected as I2C4 clock

10: HSI16 clock selected as I2C4 clock

11: reserved

### 6.4.33 RCC register map

The following table gives the RCC register map and the reset values.

a. Register is present on L496/L4A6 devices only.

Table 34. RCC register map and reset values

| Off-set | Register                   | 31                 | 30            | 29         | 28   | 27               | 26   | 25         | 24          | 23        | 22   | 21               | 20   | 19         | 18           | 17   | 16   | 15       | 14         | 13   | 12          | 11             | 10          | 9    | 8           | 7               | 6         | 5           | 4    | 3         | 2    | 1        | 0    |               |  |

1. Only for STM32L47x/L48x devices

2. Only for STM32L49x/L4Ax devices

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 7 Clock recovery system (CRS)

This section applies only to STM32L49x/L4Ax devices.

### 7.1 CRS introduction

The clock recovery system (CRS) is an advanced digital controller acting on the internal fine-granularity trimmable RC oscillator HSI48. The CRS provides powerful means to evaluate the oscillator output frequency, based on comparison with a selectable synchronization signal. The CRS can perform automatic trimming adjustments based on the measured frequency error value, while keeping the possibility of a manual trimming.

The CRS is ideally suited to provide a precise clock to the USB peripheral. In this case, the synchronization signal can be derived from the start-of-frame (SOF) packet signalization on the USB bus, sent by a USB host at 1 ms intervals.

The synchronization signal can also be derived from the LSE oscillator output, or generated by user software.

### 7.2 CRS main features

- Selectable synchronization source with programmable prescaler and polarity:
  - External pin
  - LSE oscillator output
  - USB SOF packet reception
- Possibility to generate synchronization pulses by software
- Automatic oscillator trimming capability with no need of CPU action
- Manual control option for faster startup convergence
- 16-bit frequency error counter with automatic error value capture and reload
- Programmable limit for automatic frequency error value evaluation and status reporting
- Maskable interrupts/events:
  - Expected synchronization (ESYNC)
  - Synchronization OK (SYNCOK)
  - Synchronization warning (SYNCWARN)
  - Synchronization or trimming error (ERR)

### 7.3 CRS implementation

Table 35. CRS features

| Feature    | CRS    |
|------------|--------|
| TRIM width | 6 bits |

## 7.4 CRS functional description

### 7.4.1 CRS block diagram

Figure 21. CRS block diagram

### 7.4.2 Synchronization input

The CRS synchronization (SYNC) source, selectable through the CRS\_CFGR register, can be the signal from the LSE clock or the USB SOF signal. For better robustness of the SYNC input, a simple digital filter (2 out of 3 majority votes, sampled by the HSI48 clock) is implemented to filter out glitches. This source signal has a configurable polarity, and can be divided by a programmable binary prescaler, to obtain a synchronization signal in a suitable frequency range (usually around 1 kHz).

For more information on the CRS synchronization source configuration, refer to [Section 7.7.2](#).

It is also possible to generate a synchronization event by software, by setting the SWSYNC bit in the CRS\_CR register.

### 7.4.3 Frequency error measurement

The frequency error counter is a 16-bit down/up counter, reloaded with the RELOAD value on each SYNC event. It starts counting down until it reaches the zero value, where the ESYNC (expected synchronization) event is generated. Then it starts counting up to the OUTRANGE limit, where it eventually stops (if no SYNC event is received), and generates a SYNCMISS event. The OUTRANGE limit is defined as the frequency error limit (FELIM field of the CRS\_CFGR register) multiplied by 128.

When the SYNC event is detected, the actual value of the frequency error counter and its counting direction are stored in the FECAP (frequency error capture) field and in the FEDIR (frequency error direction) bit of the CRS\_ISR register. When the SYNC event is detected during the down-counting phase (before reaching the zero value), it means that the actual frequency is lower than the target (the TRIM value must be incremented). When it is detected during the up-counting phase, it means that the actual frequency is higher (the TRIM value must be decremented).

Figure 22. CRS counter behavior

### 7.4.4 Frequency error evaluation and automatic trimming

The measured frequency error is evaluated by comparing its value with a set of limits:

- TOLERANCE LIMIT, given directly in the FELIM field of the CRS\_CFGR register
- WARNING LIMIT, defined as  $3 \times \text{FELIM}$  value
- OUTRANGE (error limit), defined as  $128 \times \text{FELIM}$  value

The result of this comparison is used to generate the status indication and also to control the automatic trimming, which is enabled by setting the AUTOTRIMEN bit in the CRS\_CR register:

- When the frequency error is below the tolerance limit, it means that the actual trimming value in the TRIM field is the optimal one, hence no trimming action is needed.
  - SYNCOK status indicated
  - TRIM value not changed in AUTOTRIM mode
- When the frequency error is below the warning limit but above or equal to the tolerance limit, it means that some trimming action is necessary but that adjustment by one trimming step is enough to reach the optimal TRIM value.
  - SYNCOK status indicated
  - TRIM value adjusted by one trimming step in AUTOTRIM mode
- When the frequency error is above or equal to the warning limit but below the error limit, a stronger trimming action is necessary, and there is a risk that the optimal TRIM value is not reached for the next period.
  - SYNCWARN status indicated
  - TRIM value adjusted by two trimming steps in AUTOTRIM mode
- When the frequency error is above or equal to the error limit, the frequency is out of the trimming range. This can also happen when the SYNC input is not clean, or when some SYNC pulse is missing (for example when one USB SOF is corrupted).
  - SYNCERR or SYNCMISS status indicated
  - TRIM value not changed in AUTOTRIM mode

*Note:* If the actual value of the TRIM field is close to its limits and the automatic trimming can force it to overflow or underflow, the TRIM value is set to the limit, and the TRIMOVF status is indicated.

*In AUTOTRIM mode (AUTOTRIMEN bit set in the CRS\_CR register), the TRIM field of CRS\_CR is adjusted by hardware and is read-only.*

### 7.4.5 CRS initialization and configuration

#### RELOAD value

The RELOAD value must be selected according to the ratio between the target frequency and the frequency of the synchronization source after prescaling. This value is decreased by 1, to reach the expected synchronization on the zero value. The formula is the following:

$$\text{RELOAD} = (f_{\text{TARGET}} / f_{\text{SYNC}}) - 1$$

The reset value of the RELOAD field corresponds to a target frequency of 48 MHz and a synchronization signal frequency of 1 kHz (SOF signal from USB).

#### FELIM value

The selection of the FELIM value is closely coupled with the HSI48 oscillator characteristics and its typical trimming step size. The optimal value corresponds to half of the trimming step size, expressed as a number of oscillator clock ticks. The following formula can be used:

$$\text{FELIM} = (f_{\text{TARGET}} / f_{\text{SYNC}}) * \text{STEP}[\%] / 100\% / 2$$

The result must be always rounded up to the nearest integer value to obtain the best trimming response. If frequent trimming actions are not needed in the application, the hysteresis can be increased by slightly increasing the FELIM value.

The reset value of the FELIM field corresponds to  $(f_{\text{TARGET}} / f_{\text{SYNC}}) = 48000$ , and to a typical trimming step size of 0.14%.

**Note:** The trimming step size depends upon the product, check the datasheet for accurate setting.

**Caution:** There is no hardware protection from a wrong configuration of the RELOAD and FELIM fields, this can lead to an erratic trimming response. The expected operational mode requires proper setup of the RELOAD value (according to the synchronization source frequency), which is also greater than  $128 * \text{FELIM}$  value (OUTRANGE limit).

## 7.5 CRS low-power modes

**Table 36. Effect of low-power modes on CRS**

| Mode     | Description                                                                                                            |
|----------|------------------------------------------------------------------------------------------------------------------------|
| Sleep    | No effect. CRS interrupts cause the device to exit the Sleep mode.                                                     |
| Stop     | CRS registers are frozen. The CRS stops operating until the Stop mode is exited and the HSI48 oscillator is restarted. |
| Standby  | The CRS peripheral is powered down and must be reinitialized after exiting Standby mode.                               |
| Shutdown | The CRS peripheral is powered down and must be reinitialized after exiting Shutdown mode.                              |

## 7.6 CRS interrupts

**Table 37. Interrupt control bits**

| Interrupt event                                                | Event flag | Enable control bit | Clear flag bit |
|----------------------------------------------------------------|------------|--------------------|----------------|
| Expected synchronization                                       | ESYNCF     | ESYNCIE            | ESYNCC         |
| Synchronization OK                                             | SYNCOF     | SYNCOIE            | SYNCOCK        |
| Synchronization warning                                        | SYNCF      | SYNCFIE            | SYNCFNC        |
| Synchronization or trimming error (TRIMOVF, SYNCMISS, SYNCERR) | ERRF       | ERRIE              | ERRC           |

## 7.7 CRS registers

Refer to [Section 1.2 on page 69](#) for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed only by words (32-bit).

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:8 **TRIM[5:0]**: HSI48 oscillator smooth trimming

These bits provide a user-programmable trimming value to the HSI48 oscillator. They can be programmed to adjust to variations in voltage and temperature that influence the oscillator frequency.

The default value is 32, corresponding to the middle of the trimming interval. The trimming step is specified in the product datasheet. A higher TRIM value corresponds to a higher output frequency.

When the AUTOTRIMEN bit is set, this field is controlled by hardware and is read-only.

Bit 7 **SWSYNC**: Generate software SYNC event

This bit is set by software in order to generate a software SYNC event. It is automatically cleared by hardware.

0: No action

1: A software SYNC event is generated.

Bit 6 **AUTOTRIMEN**: Automatic trimming enable

This bit enables the automatic hardware adjustment of TRIM bits according to the measured frequency error between two SYNC events. If this bit is set, the TRIM bits are read-only. The TRIM value can be adjusted by hardware by one or two steps at a time, depending on the measured frequency error value. Refer to [Section 7.4.4](#) for more details.

0: Automatic trimming disabled, TRIM bits can be adjusted by the user.

1: Automatic trimming enabled, TRIM bits are read-only and under hardware control.

Bit 5 **CEN**: Frequency error counter enable

This bit enables the oscillator clock for the frequency error counter.

0: Frequency error counter disabled

1: Frequency error counter enabled

When this bit is set, the CRS\_CFGR register is write-protected and cannot be modified.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **ESYNCIE**: Expected SYNC interrupt enable

0: Expected SYNC (ESYNCF) interrupt disabled

1: Expected SYNC (ESYNCF) interrupt enabled

- Bit 2 **ERRIE**: Synchronization or trimming error interrupt enable  
 0: Synchronization or trimming error (ERRF) interrupt disabled  
 1: Synchronization or trimming error (ERRF) interrupt enabled
- Bit 1 **SYNCWARNIE**: SYNC warning interrupt enable  
 0: SYNC warning (SYNCWARNF) interrupt disabled  
 1: SYNC warning (SYNCWARNF) interrupt enabled
- Bit 0 **SYNCOKIE**: SYNC event OK interrupt enable  
 0: SYNC event OK (SYNCOKF) interrupt disabled  
 1: SYNC event OK (SYNCOKF) interrupt enabled

### 7.7.2 CRS configuration register (CRS\_CFGR)

This register can be written only when the frequency error counter is disabled (the CEN bit is cleared in CRS\_CR). When the counter is enabled, this register is write-protected.

Address offset: 0x04

Reset value: 0x2022 BB7F

|              |      |              |    |      |              |    |    |            |    |    |    |    |    |    |    |

- Bit 31 **SYNCPOL**: SYNC polarity selection  
 This bit is set and cleared by software to select the input polarity for the SYNC signal source.  
 0: SYNC active on rising edge (default)  
 1: SYNC active on falling edge

Bit 30 Reserved, must be kept at reset value.

Bits 29:28 **SYNCSRC[1:0]**: SYNC signal source selection

- These bits are set and cleared by software to select the SYNC signal source.  
 00: GPIO selected as SYNC signal source  
 01: LSE selected as SYNC signal source  
 10: USB SOF selected as SYNC signal source (default).  
 11: Reserved

*Note: When using USB LPM (link power management) and the device is in Sleep mode, the periodic USB SOF is not generated by the host. No SYNC signal is therefore provided to the CRS to calibrate the HSI48 oscillator on the run. To guarantee the required clock precision after waking up from Sleep mode, the LSE or reference clock on the GPIOs should be used as SYNC signal.*

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **SYNCDIV[2:0]**: SYNC divider

These bits are set and cleared by software to control the division factor of the SYNC signal.

000: SYNC not divided (default)

001: SYNC divided by 2

010: SYNC divided by 4

011: SYNC divided by 8

100: SYNC divided by 16

101: SYNC divided by 32

110: SYNC divided by 64

111: SYNC divided by 128

Bits 23:16 **FELIM[7:0]**: Frequency error limit

FELIM contains the value to be used to evaluate the captured frequency error value latched in the FECAP[15:0] bits of the CRS\_ISR register. Refer to [Section 7.4.4](#) for more details about FECAP evaluation.

Bits 15:0 **RELOAD[15:0]**: Counter reload value

RELOAD is the value to be loaded in the frequency error counter with each SYNC event.

Refer to [Section 7.4.3](#) for more details about counter behavior.

### 7.7.3 CRS interrupt and status register (CRS\_ISR)

Address offset: 0x08

Reset value: 0x0000 0000

| 31          | 30   | 29   | 28   | 27   | 26       | 25        | 24       | 23   | 22   | 21   | 20   | 19     | 18   | 17         | 16       |

| FEDIR       | Res. | Res. | Res. | Res. | TRIM OVF | SYNC MISS | SYNC ERR | Res. | Res. | Res. | Res. | ESYNCF | ERRF | SYNC WARNF | SYNC OKF |
| r           |      |      |      |      | r        | r         | r        |      |      |      |      | r      | r    | r          | r        |

Bits 31:16 **FECAP[15:0]**: Frequency error capture

FECAP is the frequency error counter value latched in the time of the last SYNC event.

Refer to [Section 7.4.4](#) for more details about FECAP usage.

Bit 15 **FEDIR**: Frequency error direction

FEDIR is the counting direction of the frequency error counter latched in the time of the last SYNC event. It shows whether the actual frequency is below or above the target.

0: Up-counting direction, the actual frequency is above the target

1: Down-counting direction, the actual frequency is below the target

Bits 14:11 Reserved, must be kept at reset value.

Bit 10 **TRIMOVF**: Trimming overflow or underflow

This flag is set by hardware when the automatic trimming tries to over- or under-flow the TRIM value. An interrupt is generated if the ERRIE bit is set in the CRS\_CR register. It is cleared by software by setting the ERRC bit in the CRS\_ICR register.

0: No trimming error signaled

1: Trimming error signaled

Bit 9 **SYNCMISS**: SYNC missed

This flag is set by hardware when the frequency error counter reaches value  $FELIM * 128$  and no SYNC is detected, meaning either that a SYNC pulse was missed, or the frequency error is too big (internal frequency too high) to be compensated by adjusting the TRIM value, hence some other action must be taken. At this point, the frequency error counter is stopped (waiting for a next SYNC), and an interrupt is generated if the ERRIE bit is set in the CRS\_CR register. It is cleared by software by setting the ERRRC bit in the CRS\_ICR register.

0: No SYNC missed error signaled  
1: SYNC missed error signaled

Bit 8 **SYNCERR**: SYNC error

This flag is set by hardware when the SYNC pulse arrives before the ESYNC event and the measured frequency error is greater than or equal to  $FELIM * 128$ . This means that the frequency error is too big (internal frequency too low) to be compensated by adjusting the TRIM value, and that some other action has to be taken. An interrupt is generated if the ERRIE bit is set in the CRS\_CR register. It is cleared by software by setting the ERRRC bit in the CRS\_ICR register.

0: No SYNC error signaled  
1: SYNC error signaled

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **ESYNCF**: Expected SYNC flag

This flag is set by hardware when the frequency error counter reached a zero value. An interrupt is generated if the ESYNCIE bit is set in the CRS\_CR register. It is cleared by software by setting the ESYNCC bit in the CRS\_ICR register.

0: No expected SYNC signaled  
1: Expected SYNC signaled

Bit 2 **ERRF**: Error flag

This flag is set by hardware in case of any synchronization or trimming error. It is the logical OR of the TRIMOVF, SYNCMISS and SYNCERR bits. An interrupt is generated if the ERRIE bit is set in the CRS\_CR register. It is cleared by software in reaction to setting the ERRRC bit in the CRS\_ICR register, which clears the TRIMOVF, SYNCMISS and SYNCERR bits.

0: No synchronization or trimming error signaled  
1: Synchronization or trimming error signaled

Bit 1 **SYNCWARNF**: SYNC warning flag

This flag is set by hardware when the measured frequency error is greater than or equal to  $FELIM * 3$ , but smaller than  $FELIM * 128$ . This means that to compensate the frequency error, the TRIM value must be adjusted by two steps or more. An interrupt is generated if the SYNCWARNIE bit is set in the CRS\_CR register. It is cleared by software by setting the SYNCWARNC bit in the CRS\_ICR register.

0: No SYNC warning signaled  
1: SYNC warning signaled

Bit 0 **SYNCOKF**: SYNC event OK flag

This flag is set by hardware when the measured frequency error is smaller than  $FELIM * 3$ . This means that either no adjustment of the TRIM value is needed or that an adjustment by one trimming step is enough to compensate the frequency error. An interrupt is generated if the SYNCOKIE bit is set in the CRS\_CR register. It is cleared by software by setting the SYNCOKC bit in the CRS\_ICR register.

0: No SYNC event OK signaled  
1: SYNC event OK signaled

### 7.7.4 CRS interrupt flag clear register (CRS\_ICR)

Address offset: 0x0C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |        |      |           |         |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ESYNCC | ERRC | SYNCWARNC | SYNCOKC |
|      |      |      |      |      |      |      |      |      |      |      |      | rw     | rw   | rw        | rw      |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ESYNCC**: Expected SYNC clear flag

Writing 1 to this bit clears the ESYNCF flag in the CRS\_ISR register.

Bit 2 **ERRC**: Error clear flag

Writing 1 to this bit clears TRIMOVF, SYNCMISS, and SYNCERR bits and consequently also the ERRF flag in the CRS\_ISR register.

Bit 1 **SYNCWARNC**: SYNC warning clear flag

Writing 1 to this bit clears the SYNCWARNF flag in the CRS\_ISR register.

Bit 0 **SYNCOKC**: SYNC event OK clear flag

Writing 1 to this bit clears the SYNCOKF flag in the CRS\_ISR register.

### 7.7.5 CRS register map

Table 38. CRS register map and reset values

| Offset | Register name<br>Reset value | 31          | 30   | 29             | 28   | 27   | 26             | 25   | 24         | 23   | 22   | 21   | 20   | 19   | 18           | 17   | 16    | 15   | 14   | 13        | 12   | 11   | 10      | 9        | 8       | 7      | 6    | 5          | 4    | 3      | 2      | 1         | 0          |          |

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 8 General-purpose I/Os (GPIO)

### 8.1 Introduction

Each general-purpose I/O port has four 32-bit configuration registers (GPIOx\_MODER, GPIOx\_OTYPER, GPIOx\_OSPEEDR and GPIOx\_PUPDR), two 32-bit data registers (GPIOx\_IDR and GPIOx\_ODR) and a 32-bit set/reset register (GPIOx\_BSRR). In addition all GPIOs have a 32-bit locking register (GPIOx\_LCKR) and two 32-bit alternate function selection registers (GPIOx\_AFRH and GPIOx\_AFRL).

### 8.2 GPIO main features

- Output states: push-pull or open drain + pull-up/down
- Output data from output data register (GPIOx\_ODR) or peripheral (alternate function output)
- Speed selection for each I/O
- Input states: floating, pull-up/down, analog
- Input data to input data register (GPIOx\_IDR) or peripheral (alternate function input)
- Bit set and reset register (GPIOx\_BSRR) for bitwise write access to GPIOx\_ODR
- Locking mechanism (GPIOx\_LCKR) provided to freeze the I/O port configurations
- Analog function
- Alternate function selection registers
- Fast toggle capable of changing every two clock cycles
- Highly flexible pin multiplexing allows the use of I/O pins as GPIOs or as one of several peripheral functions

### 8.3 GPIO implementation

On STM32L47x/L48x, up to 114 I/Os are available (from PA0 to PH1).

On STM32L49x/L4Ax, up to 136 I/Os are available (from PA0 to PI11).

## 8.4 GPIO functional description

Subject to the specific hardware characteristics of each I/O port listed in the datasheet, each port bit of the general-purpose I/O (GPIO) ports can be individually configured by software in several modes:

- Input floating
- Input pull-up
- Input-pull-down
- Analog
- Output open-drain with pull-up or pull-down capability
- Output push-pull with pull-up or pull-down capability
- Alternate function push-pull with pull-up or pull-down capability
- Alternate function open-drain with pull-up or pull-down capability

Each I/O port bit is freely programmable, however the I/O port registers have to be accessed as 32-bit words, half-words or bytes. The purpose of the GPIOx\_BSRR register is to allow atomic read/modify accesses to any of the GPIOx\_ODR registers. In this way, there is no risk of an IRQ occurring between the read and the modify access.

[Figure 23](#) and [Figure 24](#) show the basic structures of a standard and a 5-Volt tolerant I/O port bit, respectively. [Table 39](#) gives the possible port bit configurations.

**Figure 23. Basic structure of an I/O port bit**

Figure 24. Basic structure of a 5-Volt tolerant I/O port bit

1.  $V_{DD\_FT}$  is a potential specific to 5-Volt tolerant I/Os and different from  $V_{DD}$ .

Table 39. Port bit configuration table<sup>(1)</sup>

| MODE(i)<br>[1:0] | OTYPER(i) | OSPEED(i)<br>[1:0] | PUPD(i)<br>[1:0] |   | I/O configuration       |         |
|------------------|-----------|--------------------|------------------|---|-------------------------|---------|
| 01               | 0         | SPEED<br>[1:0]     | 0                | 0 | GP output               | PP      |
|                  | 0         |                    | 0                | 1 | GP output               | PP + PU |
|                  | 0         |                    | 1                | 0 | GP output               | PP + PD |
|                  | 0         |                    | 1                | 1 | Reserved                |         |
|                  | 1         |                    | 0                | 0 | GP output               | OD      |
|                  | 1         |                    | 0                | 1 | GP output               | OD + PU |
|                  | 1         |                    | 1                | 0 | GP output               | OD + PD |
|                  | 1         |                    | 1                | 1 | Reserved (GP output OD) |         |

1. GP = general-purpose, PP = push-pull, PU = pull-up, PD = pull-down, OD = open-drain, AF = alternate function.

### 8.4.1 General-purpose I/O (GPIO)

During and just after reset, the alternate functions are not active and most of the I/O ports are configured in analog mode.

The debug pins are in AF pull-up/pull-down after reset:

- PA15: JTDI in pull-up
- PA14: JTCK/SWCLK in pull-down
- PA13: JTMS/SWDAT in pull-up
- PB4: NJTRST in pull-up
- PB3: JTDO in floating state no pull-up/pull-down

On STM32L49x/L4Ax devices, PH3/BOOT0 is in input mode during the reset until at least the end of the option byte loading phase. See [Section 8.4.15: Using PH3 as GPIO \(only for STM32L49x/L4Ax devices\)](#).

When the pin is configured as output, the value written to the output data register (GPIOx\_ODR) is output on the I/O pin. It is possible to use the output driver in push-pull mode or open-drain mode (only the low level is driven, high level is HI-Z).

The input data register (GPIOx\_IDR) captures the data present on the I/O pin at every AHB clock cycle.

All GPIO pins have weak internal pull-up and pull-down resistors, which can be activated or not depending on the value in the GPIOx\_PUPDR register.

### 8.4.2 I/O pin alternate function multiplexer and mapping

The device I/O pins are connected to on-board peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an I/O pin at a time. In this way, there can be no conflict between peripherals available on the same I/O pin.

Each I/O pin (except PH3 for STM32L49x/L4Ax devices) has a multiplexer with up to sixteen alternate function inputs (AF0 to AF15) that can be configured through the GPIOx\_AFRL (for pin 0 to 7) and GPIOx\_AFRH (for pin 8 to 15) registers:

- After reset the multiplexer selection is alternate function 0 (AF0). The I/Os are configured in alternate function mode through GPIOx\_MODER register.
- The specific alternate function assignments for each pin are detailed in the device datasheet.

In addition to this flexible I/O multiplexing architecture, each peripheral has alternate functions mapped onto different I/O pins to optimize the number of peripherals available in smaller packages.

To use an I/O in a given configuration, the user has to proceed as follows:

- **Debug function:** after each device reset these pins are assigned as alternate function pins immediately usable by the debugger host
- **GPIO:** configure the desired I/O as output, input or analog in the GPIOx\_MODER register.
- **Peripheral alternate function:**
  - Connect the I/O to the desired AFx in one of the GPIOx\_AFRL or GPIOx\_AFRH register.
  - Select the type, pull-up/pull-down and output speed via the GPIOx\_OTYPER, GPIOx\_PUPDR and GPIOx\_OSPEEDER registers, respectively.
  - Configure the desired I/O as an alternate function in the GPIOx\_MODER register.
- **Additional functions:**
  - For the ADC, DAC, OPAMP and COMP, configure the desired I/O in analog mode in the GPIOx\_MODER register and configure the required function in the ADC, DAC, OPAMP, and COMP registers. For the ADC, it is necessary to configure the GPIOx\_ASCR register (only for STM32L47x/L48x).
  - For the additional functions like RTC, WKUPx and oscillators, configure the required function in the related RTC, PWR and RCC registers. These functions have priority over the configuration in the standard GPIO registers.

Refer to the “Alternate function mapping” table in the device datasheet for the detailed mapping of the alternate function I/O pins.

### 8.4.3 I/O port control registers

Each of the GPIO ports has four 32-bit memory-mapped control registers (GPIOx\_MODER, GPIOx\_OTYPER, GPIOx\_OSPEEDR, GPIOx\_PUPDR) to configure up to 16 I/Os. The GPIOx\_MODER register is used to select the I/O mode (input, output, AF, analog). The GPIOx\_OTYPER and GPIOx\_OSPEEDR registers are used to select the output type (push-pull or open-drain) and speed. The GPIOx\_PUPDR register is used to select the pull-up/pull-down whatever the I/O direction.

### 8.4.4 I/O port data registers

Each GPIO has two 16-bit memory-mapped data registers: input and output data registers (GPIOx\_IDR and GPIOx\_ODR). GPIOx\_ODR stores the data to be output, it is read/write accessible. The data input through the I/O are stored into the input data register (GPIOx\_IDR), a read-only register.

See [Section 8.5.5: GPIO port input data register \(GPIOx\\_IDR\) \(x = A to I\)](#) and [Section 8.5.6: GPIO port output data register \(GPIOx\\_ODR\) \(x = A to I\)](#) for the register descriptions.

#### 8.4.5 I/O data bitwise handling

The bit set reset register (GPIOx\_BSRR) is a 32-bit register which allows the application to set and reset each individual bit in the output data register (GPIOx\_ODR). The bit set reset register has twice the size of GPIOx\_ODR.

To each bit in GPIOx\_ODR, correspond two control bits in GPIOx\_BSRR: BS(i) and BR(i). When written to 1, bit BS(i) **sets** the corresponding ODR(i) bit. When written to 1, bit BR(i) **resets** the ODR(i) corresponding bit.

Writing any bit to 0 in GPIOx\_BSRR does not have any effect on the corresponding bit in GPIOx\_ODR. If there is an attempt to both set and reset a bit in GPIOx\_BSRR, the set action takes priority.

Using the GPIOx\_BSRR register to change the values of individual bits in GPIOx\_ODR is a “one-shot” effect that does not lock the GPIOx\_ODR bits. The GPIOx\_ODR bits can always be accessed directly. The GPIOx\_BSRR register provides a way of performing atomic bitwise handling.

There is no need for the software to disable interrupts when programming the GPIOx\_ODR at bit level: it is possible to modify one or more bits in a single atomic AHB write access.

#### 8.4.6 GPIO locking mechanism

It is possible to freeze the GPIO control registers by applying a specific write sequence to the GPIOx\_LCKR register. The frozen registers are GPIOx\_MODER, GPIOx\_OTYPER, GPIOx\_OSPEEDR, GPIOx\_PUPDR, GPIOx\_AFRL and GPIOx\_AFRH.

To write the GPIOx\_LCKR register, a specific write / read sequence has to be applied. When the right LOCK sequence is applied to bit 16 in this register, the value of LCKR[15:0] is used to lock the configuration of the I/Os (during the write sequence the LCKR[15:0] value must be the same). When the LOCK sequence has been applied to a port bit, the value of the port bit can no longer be modified until the next MCU reset or peripheral reset. Each GPIOx\_LCKR bit freezes the corresponding bit in the control registers (GPIOx\_MODER, GPIOx\_OTYPER, GPIOx\_OSPEEDR, GPIOx\_PUPDR, GPIOx\_AFRL and GPIOx\_AFRH).

The LOCK sequence (refer to [Section 8.5.8: GPIO port configuration lock register \(GPIOx\\_LCKR\) \(x = A to I\)](#)) can only be performed using a word (32-bit long) access to the GPIOx\_LCKR register due to the fact that GPIOx\_LCKR bit 16 has to be set at the same time as the [15:0] bits.

For more details refer to LCKR register description in [Section 8.5.8: GPIO port configuration lock register \(GPIOx\\_LCKR\) \(x = A to I\)](#).

#### 8.4.7 I/O alternate function input/output

Two registers are provided to select one of the alternate function inputs/outputs available for each I/O. With these registers, the user can connect an alternate function to some other pin as required by the application.

This means that a number of possible peripheral functions are multiplexed on each GPIO using the GPIOx\_AFRL and GPIOx\_AFRH alternate function registers. The application can thus select any one of the possible functions for each I/O. The AF selection signal being

common to the alternate function input and alternate function output, a single channel is selected for the alternate function input/output of a given I/O.

To know which functions are multiplexed on each GPIO pin refer to the device datasheet.

#### 8.4.8 External interrupt/wake-up lines

All ports have external interrupt capability. To use external interrupt lines, the port can be configured in input, output or alternate function mode (the port must not be configured in analog mode).

Refer to [Section 14: Extended interrupts and events controller \(EXTI\)](#) and to [Section 14.3.2: Wakeup event management](#).

#### 8.4.9 Input configuration

When the I/O port is programmed as input:

- The output buffer is disabled
- The Schmitt trigger input is activated
- The pull-up and pull-down resistors are activated depending on the value in the GPIOx\_PUPDR register
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle
- A read access to the input data register provides the I/O state

[Figure 25](#) shows the input configuration of the I/O port bit.

**Figure 25. Input floating / pull up / pull down configurations**

### 8.4.10 Output configuration

When the I/O port is programmed as output:

- The output buffer is enabled:
  - Open drain mode: a “0” in the output register activates the N-MOS whereas a “1” in the output register leaves the port in Hi-Z (the P-MOS is never activated)
  - Push-pull mode: a “0” in the output register activates the N-MOS whereas a “1” in the output register activates the P-MOS
- The Schmitt trigger input is activated
- The pull-up and pull-down resistors are activated depending on the value in the GPIOx\_PUPDR register
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle
- A read access to the input data register gets the I/O state
- A read access to the output data register gets the last written value

Figure 26 shows the output configuration of the I/O port bit.

Figure 26. Output configuration

### 8.4.11 Alternate function configuration

When the I/O port is programmed as alternate function:

- The output buffer can be configured in open-drain or push-pull mode
- The output buffer is driven by the signals coming from the peripheral (transmitter enable and data)
- The Schmitt trigger input is activated
- The weak pull-up and pull-down resistors are activated or not depending on the value in the GPIOx\_PUPDR register
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle
- A read access to the input data register gets the I/O state

**Note:** The alternate function configuration described above is not applied when the selected alternate function is an LCD function or a SWPMI\_IO. In this case, the I/O, programmed as an alternate function output, is configured as described in the analog configuration.

Figure 27 shows the alternate function configuration of the I/O port bit.

**Figure 27. Alternate function configuration**

#### 8.4.12 Analog configuration

When the I/O port is programmed as analog configuration:

- The output buffer is disabled
- The Schmitt trigger input is deactivated, providing zero consumption for every analog value of the I/O pin. The output of the Schmitt trigger is forced to a constant value (0).
- The weak pull-up and pull-down resistors are disabled by hardware
- Read access to the input data register gets the value "0"

Figure 28 shows the high-impedance, analog-input configuration of the I/O port bits.

**Figure 28. High impedance-analog configuration**

#### 8.4.13 Using the HSE or LSE oscillator pins as GPIOs

When the HSE or LSE oscillator is switched OFF (default state after reset), the related oscillator pins can be used as normal GPIOs.

When the HSE or LSE oscillator is switched ON (by setting the HSEON or LSEON bit in the RCC\_CR or RCC\_BDCR register) the oscillator takes control of its associated pins and the GPIO configuration of these pins has no effect.

When the oscillator is configured in a user external clock mode, only the pin is reserved for clock input and the OSC\_OUT or OSC32\_OUT pin can still be used as normal GPIO.

#### 8.4.14 Using the GPIO pins in the RTC supply domain

The PC13/PC14/PC15 GPIO functionality is lost when the core supply domain is powered off (when the device enters Standby mode). In this case, if their GPIO configuration is not bypassed by the RTC configuration, these pins are set in an analog input mode.

For details about I/O control by the RTC, refer to [Section 38.3: RTC functional description](#).

#### 8.4.15 Using PH3 as GPIO (only for STM32L49x/L4Ax devices)

PH3 may be used as boot pin (BOOT0) or as a GPIO. Depending on the nSWBOOT0 bit in the user option byte, it switches from the input mode to the analog input mode:

- After the option byte loading phase if nSWBOOT0 = 1.
- After reset if nSWBOOT0 = 0.

## 8.5 GPIO registers

For a summary of register bits, register address offsets and reset values, refer to [Table 40](#).

The peripheral registers can be written in word, half word or byte mode.

### 8.5.1 GPIO port mode register (GPIOx\_MODER) (x = A to I)

Address offset: 0x00

Reset value: 0xABFF FFFF (for port A)

Reset value: 0xFFFF FEBF (for port B)

On STM32L47x/L48x:

Reset value: 0xFFFF FFFF (for ports C..G)

Reset value: 0x0000 000F (for port H)

On STM32L49x/L4Ax:

Reset value: 0xFFFF FFFF (for ports C..H)

Reset value: 0x00FF FFFF (for port I)

|             |    |             |    |             |    |             |    |             |    |             |    |            |    |            |    |

| OT15 | OT14 | OT13 | OT12 | OT11 | OT10 | OT9  | OT8  | OT7  | OT6  | OT5  | OT4  | OT3  | OT2  | OT1  | OT0  |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **OT[15:0]**: Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O output type.

0: Output push-pull (reset state)

1: Output open-drain

### 8.5.3 GPIO port output speed register (GPIOx\_OSPEEDR) (x = A to I)

Address offset: 0x08

Reset value: 0x0C00 0000 (for port A)

Reset value: 0x0000 0000 (for the other ports)

|                   |    |                   |    |                   |    |                   |    |                   |    |                   |    |                  |    |                  |    |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| ID15 | ID14 | ID13 | ID12 | ID11 | ID10 | ID9  | ID8  | ID7  | ID6  | ID5  | ID4  | ID3  | ID2  | ID1  | ID0  |
| r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ID[15:0]**: Port x input data I/O pin y (y = 15 to 0)

These bits are read-only. They contain the input value of the corresponding I/O port.

### 8.5.6 GPIO port output data register (GPIOx\_ODR) (x = A to I)

Address offset: 0x14

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| OD15 | OD14 | OD13 | OD12 | OD11 | OD10 | OD9  | OD8  | OD7  | OD6  | OD5  | OD4  | OD3  | OD2  | OD1  | OD0  |
| rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **OD[15:0]**: Port output data I/O pin y (y = 15 to 0)

These bits can be read and written by software.

*Note: For atomic bit set/reset, the OD bits can be individually set and/or reset by writing to the GPIOx\_BSRR register (x = A..FA to H).*

### 8.5.7 GPIO port bit set/reset register (GPIOx\_BSRR) (x = A to I)

Address offset: 0x18

Reset value: 0x0000 0000

|      |      |      |      |      |      |     |     |     |     |     |     |     |     |     |     |
|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| BR15 | BR14 | BR13 | BR12 | BR11 | BR10 | BR9 | BR8 | BR7 | BR6 | BR5 | BR4 | BR3 | BR2 | BR1 | BR0 |
| w    | w    | w    | w    | w    | w    | w   | w   | w   | w   | w   | w   | w   | w   | w   | w   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| BS15 | BS14 | BS13 | BS12 | BS11 | BS10 | BS9 | BS8 | BS7 | BS6 | BS5 | BS4 | BS3 | BS2 | BS1 | BS0 |
| w    | w    | w    | w    | w    | w    | w   | w   | w   | w   | w   | w   | w   | w   | w   | w   |

Bits 31:16 **BR[15:0]**: Port x reset I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Resets the corresponding ODx bit

*Note: If both BSx and BRx are set, BSx has priority.*

Bits 15:0 **BS[15:0]**: Port x set I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Sets the corresponding ODx bit

### 8.5.8 GPIO port configuration lock register (GPIOx\_LCKR) (x = A to I)

This register is used to lock the configuration of the port bits when a correct write sequence is applied to bit 16 (LCKK). The value of bits [15:0] is used to lock the configuration of the GPIO. During the write sequence, the value of LCKR[15:0] must not change. When the LOCK sequence has been applied on a port bit, the value of this port bit can no longer be modified until the next MCU reset or peripheral reset.

*Note: A specific write sequence is used to write to the GPIOx\_LCKR register. Only word access (32-bit long) is allowed during this locking sequence.*

Each lock bit freezes a specific configuration register (control and alternate function registers).

Address offset: 0x1C

Reset value: 0x0000 0000

|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |
|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| 31    | 30    | 29    | 28    | 27    | 26    | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LCKK |
|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      | rw   |
| 15    | 14    | 13    | 12    | 11    | 10    | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| LCK15 | LCK14 | LCK13 | LCK12 | LCK11 | LCK10 | LCK9 | LCK8 | LCK7 | LCK6 | LCK5 | LCK4 | LCK3 | LCK2 | LCK1 | LCK0 |
| rw    | rw    | rw    | rw    | rw    | rw    | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **LCKK**: Lock key

This bit can be read any time. It can only be modified using the lock key write sequence.

0: Port configuration lock key not active

1: Port configuration lock key active. The GPIOx\_LCKR register is locked until the next MCU reset or peripheral reset.

LOCK key write sequence:

WR LCKR[16] = 1 + LCKR[15:0]

WR LCKR[16] = 0 + LCKR[15:0]

WR LCKR[16] = 1 + LCKR[15:0]

RD LCKR

RD LCKR[16] = 1 (this read operation is optional but it confirms that the lock is active)

*Note: During the LOCK key write sequence, the value of LCK[15:0] must not change.*

*Any error in the lock sequence aborts the lock.*

*After the first lock sequence on any bit of the port, any read access on the LCKK bit returns 1 until the next MCU reset or peripheral reset.*

Bits 15:0 **LCK[15:0]**: Port x lock I/O pin y (y = 15 to 0)

These bits are read/write but can only be written when the LCKK bit is 0.

0: Port configuration not locked

1: Port configuration locked

### 8.5.9 GPIO alternate function low register (GPIOx\_AFRL) (x = A to I)

Address offset: 0x20

Reset value: 0x0000 0000

|             |    |    |    |             |    |    |    |             |    |    |    |             |    |    |    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BR[15:0]**: Port x reset IO pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Reset the corresponding ODx bit

### 8.5.12 GPIO port analog switch control register (GPIOx\_ASCR)(x = A to H<sup>a</sup>)

Address offset: 0x2C

Reset value: 0x0000 0000

|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ASC[15:0]**: Port x analog switch control I/O pin y (y= 15 to 0)

These bits are written by software to configure the analog connection of the IOs

0: Disconnect analog switch to the ADC input (reset state)

1: Connect analog switch to the ADC input

Note: This bit must be set prior to the ADC conversion.

*Only the IO which connect to the ADC input are effective. Other IOs must keep their reset value*

a. This register is only applicable to STM32L47x/L48x devices).

### 8.5.13 GPIO register map

The following table gives the GPIO register map and reset values.

**Table 40. GPIO register map and reset values**

| Offset | Register name                            | 31            | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 9 System configuration controller (SYSCFG)

### 9.1 SYSCFG main features

The STM32L47x/L48x/L49x/L4Ax devices feature a set of configuration registers. The main purposes of the system configuration controller are the following:

- Remapping memory areas
- Managing the external interrupt line connection to the GPIOs
- Managing robustness feature
- Setting SRAM2 write protection and software erase
- Configuring FPU interrupts
- Enabling the firewall
- Enabling /disabling I<sup>2</sup>C Fast-mode Plus driving capability on some I/Os and voltage booster for I/Os analog switches.

### 9.2 SYSCFG registers

#### 9.2.1 SYSCFG memory remap register (SYSCFG\_MEMRMP)

This register is used for specific configurations on memory remap.

Address offset: 0x00

Reset value: 0x0000 000X (X is the memory mode selected by the BOOT0 pin and BOOT1 option bit)

|      |      |      |      |      |      |      |            |      |      |      |      |      |               |      |      |
|------|------|------|------|------|------|------|------------|------|------|------|------|------|---------------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24         | 23   | 22   | 21   | 20   | 19   | 18            | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.       | Res. | Res. | Res. | Res. | Res. | Res.          | Res. | Res. |
|      |      |      |      |      |      |      |            |      |      |      |      |      |               |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8          | 7    | 6    | 5    | 4    | 3    | 2             | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | FB<br>MODE | Res. | Res. | Res. | Res. | Res. | MEM_MODE[2:0] |      |      |
|      |      |      |      |      |      |      | rw         |      |      |      |      |      | rw            | rw   | rw   |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **FB\_MODE**: Flash Bank mode selection

0: Flash Bank 1 mapped at 0x0800 0000 (and aliased @0x0000 0000<sup>(1)</sup>) and Flash Bank 2 mapped at 0x0808 0000 (and aliased at 0x0008 0000)

1: Flash Bank2 mapped at 0x0800 0000 (and aliased @0x0000 0000<sup>(1)</sup>) and Flash Bank 1 mapped at 0x0808 0000 (and aliased at 0x0008 0000)

Bits 7:3 Reserved, must be kept at reset value.

**Bits 2:0 MEM\_MODE[2:0]: Memory mapping selection**

These bits control the memory internal mapping at address 0x0000 0000. These bits are used to select the physical remap by software and so, bypass the BOOT pin and the option bit setting. After reset these bits take the value selected by BOOT0 pin (or option bit for STM32L49x/L4Ax devices depending on nSWBOOT0 option bit) and BOOT1 option bit.

000: Main Flash memory mapped at 0x00000000<sup>(1)</sup>.

001: System Flash memory mapped at 0x00000000.

010: FMC bank 1 (NOR/PSRAM 1 and 2) mapped at 0x00000000.

011: SRAM1 mapped at 0x00000000.

100: Reserved

101: Reserved

110: QUADSPI memory mapped at 0x00000000.

111: Reserved

1. When BFB2 bit is set, the system memory remains aliased at @0x0000 0000

**Note:** When the FSMC is remapped at address 0x0000 0000, only the first two regions of Bank 1 memory controller (Bank1 NOR/PSRAM 1 and NOR/PSRAM 2) can be remapped. In remap mode, the CPU can access the external memory via ICode bus instead of System bus which boosts up the performance.

## 9.2.2 SYSCFG configuration register 1 (SYSCFG\_CFGR1)

Address offset: 0x04

Reset value: 0x7C00 0001

| 31          | 30   | 29   | 28   | 27   | 26   | 25   | 24       | 23       | 22       | 21       | 20       | 19          | 18          | 17          | 16          |

**Bits 31:26 FPU\_IE[5:0]: Floating Point Unit interrupts enable bits**

FPU\_IE[5]: Inexact interrupt enable

FPU\_IE[4]: Input denormal interrupt enable

FPU\_IE[3]: Overflow interrupt enable

FPU\_IE[2]: underflow interrupt enable

FPU\_IE[1]: Divide-by-zero interrupt enable

FPU\_IE[0]: Invalid operation interrupt enable

Bits 25:24 Reserved, must be kept at reset value.

Bit 23 **I2C4\_FMP**: Fast-mode Plus driving capability activation (this bit is only available on STM32L49x/L4Ax, keep at reset value for other devices)

This bit enables the Fm+ driving mode on I2C4 pins selected through AF selection bits.

0: Fm+ mode is not enabled on I2C4 pins selected through AF selection bits

1: Fm+ mode is enabled on I2C4 pins selected through AF selection bits.

- Bit 22 **I2C3\_FMP**: I2C3 Fast-mode Plus driving capability activation  
This bit enables the Fm+ driving mode on I2C3 pins selected through AF selection bits.  
0: Fm+ mode is not enabled on I2C3 pins selected through AF selection bits  
1: Fm+ mode is enabled on I2C3 pins selected through AF selection bits.
- Bit 21 **I2C2\_FMP**: I2C2 Fast-mode Plus driving capability activation  
This bit enables the Fm+ driving mode on I2C2 pins selected through AF selection bits.  
0: Fm+ mode is not enabled on I2C2 pins selected through AF selection bits  
1: Fm+ mode is enabled on I2C2 pins selected through AF selection bits.
- Bit 20 **I2C1\_FMP**: I2C1 Fast-mode Plus driving capability activation  
This bit enables the Fm+ driving mode on I2C1 pins selected through AF selection bits.  
0: Fm+ mode is not enabled on I2C1 pins selected through AF selection bits  
1: Fm+ mode is enabled on I2C1 pins selected through AF selection bits.
- Bit 19 **I2C\_PB9\_FMP**: Fast-mode Plus (Fm+) driving capability activation on PB9  
This bit enables the Fm+ driving mode for PB9.  
0: PB9 pin operates in standard mode.  
1: Fm+ mode enabled on PB9 pin, and the Speed control is bypassed.
- Bit 18 **I2C\_PB8\_FMP**: Fast-mode Plus (Fm+) driving capability activation on PB8  
This bit enables the Fm+ driving mode for PB8.  
0: PB8 pin operates in standard mode.  
1: Fm+ mode enabled on PB8 pin, and the Speed control is bypassed.
- Bit 17 **I2C\_PB7\_FMP**: Fast-mode Plus (Fm+) driving capability activation on PB7  
This bit enables the Fm+ driving mode for PB7.  
0: PB7 pin operates in standard mode.  
1: Fm+ mode enabled on PB7 pin, and the Speed control is bypassed.
- Bit 16 **I2C\_PB6\_FMP**: Fast-mode Plus (Fm+) driving capability activation on PB6  
This bit enables the Fm+ driving mode for PB6.  
0: PB6 pin operates in standard mode.  
1: Fm+ mode enabled on PB6 pin, and the Speed control is bypassed.
- Bits 15:9 Reserved, must be kept at reset value.
- Bit 8 **BOOSTEN**: I/O analog switch voltage booster enable  
0: I/O analog switches are supplied by  $V_{DDA}$  voltage. This is the recommended configuration when using the ADC in high  $V_{DDA}$  voltage operation.  
1: I/O analog switches are supplied by a dedicated voltage booster (supplied by  $V_{DD}$ ). This is the recommended configuration when using the ADC in low  $V_{DDA}$  voltage operation.
- Bits 7:1 Reserved, must be kept at reset value.
- Bit 0 **FWDIS**: Firewall disable  
This bit is cleared by software to protect the access to the memory segments according to the Firewall configuration. Once enabled, the firewall cannot be disabled by software. Only a system reset set the bit.  
0 : Firewall protection enabled  
1 : Firewall protection disabled

### 9.2.3 SYSCFG external interrupt configuration register 1 (SYSCFG\_EXTICR1)

Address offset: 0x08

Reset value: 0x0000 0000

|            |      |      |      |            |      |      |      |            |      |      |      |            |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **EXTI3[3:0]**: EXTI 3 configuration bits (EXTI3[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI3 external interrupt.

0000: PA[3] pin

0001: PB[3] pin

0010: PC[3] pin

0011: PD[3] pin

0100: PE[3] pin

0101: PF[3] pin

0110: PG[3] pin

0111: PH[3] pin (only on STM32L49x/L4Ax devices)

1000: PI[3] pin (only for STM32L49x/L4Ax devices)

Bits 11:8 **EXTI2[3:0]**: EXTI 2 configuration bits (EXTI2[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI2 external interrupt.

0000: PA[2] pin

0001: PB[2] pin

0010: PC[2] pin

0011: PD[2] pin

0100: PE[2] pin

0101: PF[2] pin

0110: PG[2] pin

0111: PH[2] pin (only on STM32L49x/L4Ax devices)

1000: PI[2] pin (only for STM32L49x/L4Ax devices)

Bits 7:4 **EXTI1[3:0]**: EXTI 1 configuration bits (EXTI1[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI1 external interrupt.

0000: PA[1] pin

0001: PB[1] pin

0010: PC[1] pin

0011: PD[1] pin

0100: PE[1] pin

0101: PF[1] pin

0110: PG[1] pin

0111: PH[1] pin

1000: PI[1] pin (only for STM32L49x/L4Ax devices)

Bits 3:0 **EXTI0[3:0]**: EXTI 0 configuration bits (EXTI0[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI0 external interrupt.

0000: PA[0] pin

0001: PB[0] pin

0010: PC[0] pin

0011: PD[0] pin

0100: PE[0] pin

0101: PF[0] pin

0110: PG[0] pin

0111: PH[0] pin

1000: PI[0] pin (only for STM32L49x/L4Ax devices)

## 9.2.4 SYSCFG external interrupt configuration register 2 (SYSCFG\_EXTICR2)

Address offset: 0x0C

Reset value: 0x0000 0000

|            |      |      |      |            |      |      |      |            |      |      |      |            |      |      |      |
|------------|------|------|------|------------|------|------|------|------------|------|------|------|------------|------|------|------|
| 31         | 30   | 29   | 28   | 27         | 26   | 25   | 24   | 23         | 22   | 21   | 20   | 19         | 18   | 17   | 16   |
| Res.       | Res. | Res. | Res. | Res.       | Res. | Res. | Res. | Res.       | Res. | Res. | Res. | Res.       | Res. | Res. | Res. |
|            |      |      |      |            |      |      |      |            |      |      |      |            |      |      |      |
| 15         | 14   | 13   | 12   | 11         | 10   | 9    | 8    | 7          | 6    | 5    | 4    | 3          | 2    | 1    | 0    |
| EXTI7[3:0] |      |      |      | EXTI6[3:0] |      |      |      | EXTI5[3:0] |      |      |      | EXTI4[3:0] |      |      |      |
| rw         | rw   | rw   | rw   | rw         | rw   | rw   | rw   | rw         | rw   | rw   | rw   | rw         | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **EXTI7[3:0]**: EXTI 7 configuration bits (EXTI7[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI7 external interrupt.

0000: PA[7] pin

0001: PB[7] pin

0010: PC[7] pin

0011: PD[7] pin

0100: PE[7] pin

0101: PF[7] pin

0110: PG[7] pin

0111: PH[7] pin (only on STM32L49x/L4Ax devices)

1000: PI[7] pin (only for STM32L49x/L4Ax devices)

Bits 11:8 **EXTI6[3:0]**: EXTI 6 configuration bits (EXTI6[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI6 external interrupt.

0000: PA[6] pin

0001: PB[6] pin

0010: PC[6] pin

0011: PD[6] pin

0100: PE[6] pin

0101: PF[6] pin

0110: PG[6] pin

0111: PH[6] pin (only on STM32L49x/L4Ax devices)

1000: PI[6] pin (only for STM32L49x/L4Ax devices)

Bits 7:4 **EXTI5[3:0]**: EXTI 5 configuration bits (EXTI5[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI5 external interrupt.

0000: PA[5] pin

0001: PB[5] pin

0010: PC[5] pin

0011: PD[5] pin

0100: PE[5] pin

0101: PF[5] pin

0110: PG[5] pin

0111: PH[5] pin (only on STM32L49x/L4Ax devices)

1000: PI[5] pin (only for STM32L49x/L4Ax devices)

Bits 3:0 **EXTI4[3:0]**: EXTI 4 configuration bits (EXTI4[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI4 external interrupt.

0000: PA[4] pin

0001: PB[4] pin

0010: PC[4] pin

0011: PD[4] pin

0100: PE[4] pin

0101: PF[4] pin

0110: PG[4] pin

0111: PH[4] pin (only on STM32L49x/L4Ax devices)

1000: PI[4] pin (only for STM32L49x/L4Ax devices)

*Note:* Some of the I/O pins mentioned in the above register may not be available on small packages.

### 9.2.5 SYSCFG external interrupt configuration register 3 (SYSCFG\_EXTICR3)

Address offset: 0x10

Reset value: 0x0000 0000

|             |      |      |      |             |      |      |      |            |      |      |      |            |      |      |      |
|-------------|------|------|------|-------------|------|------|------|------------|------|------|------|------------|------|------|------|
| 31          | 30   | 29   | 28   | 27          | 26   | 25   | 24   | 23         | 22   | 21   | 20   | 19         | 18   | 17   | 16   |
| Res.        | Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res.       | Res. | Res. | Res. | Res.       | Res. | Res. | Res. |
|             |      |      |      |             |      |      |      |            |      |      |      |            |      |      |      |
| 15          | 14   | 13   | 12   | 11          | 10   | 9    | 8    | 7          | 6    | 5    | 4    | 3          | 2    | 1    | 0    |
| EXTI11[3:0] |      |      |      | EXTI10[3:0] |      |      |      | EXTI9[3:0] |      |      |      | EXTI8[3:0] |      |      |      |
| rw          | rw   | rw   | rw   | rw          | rw   | rw   | rw   | rw         | rw   | rw   | rw   | rw         | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **EXTI11[3:0]**: EXTI 11 configuration bits (EXTI11[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI11 external interrupt.

0000: PA[11] pin

0001: PB[11] pin

0010: PC[11] pin

0011: PD[11] pin

0100: PE[11] pin

0101: PF[11] pin

0110: PG[11] pin

0111: PH[11] pin (only on STM32L49x/L4Ax devices)

1000: PI[11] pin (only for STM32L49x/L4Ax devices)

Bits 11:8 **EXTI10[3:0]**: EXTI 10 configuration bits

These bits are written by software to select the source input for the EXTI10 external interrupt.

0000: PA[10] pin

0001: PB[10] pin

0010: PC[10] pin

0011: PD[10] pin

0100: PE[10] pin

0101: PF[10] pin

0110: PG[10] pin

0111: PH[10] pin (only on STM32L49x/L4Ax devices)

1000: PI[10] pin (only for STM32L49x/L4Ax devices)

Bits 7:4 **EXTI9[3:0]**: EXTI 9 configuration bits (EXTI9[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI9 external interrupt.

0000: PA[9] pin

0001: PB[9] pin

0010: PC[9] pin

0011: PD[9] pin

0100: PE[9] pin

0101: PF[9] pin

0110: PG[9] pin

0111: PH[9] pin (only on STM32L49x/L4Ax devices)

1000: PI[9] pin (only for STM32L49x/L4Ax devices)

Bits 3:0 **EXTI8[3:0]**: EXTI 8 configuration bits (EXTI8[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI8 external interrupt.

0000: PA[8] pin

0001: PB[8] pin

0010: PC[8] pin

0011: PD[8] pin

0100: PE[8] pin

0101: PF[8] pin

0110: PG[8] pin

0111: PH[8] pin (only on STM32L49x/L4Ax devices)

1000: PI[8] pin (only for STM32L49x/L4Ax devices)

**Note:** *Some of the I/O pins mentioned in the above register may not be available on small packages.*

## 9.2.6 SYSCFG external interrupt configuration register 4 (SYSCFG\_EXTICR4)

Address offset: 0x14

Reset value: 0x0000 0000

|             |      |      |      |             |      |      |      |             |      |      |      |             |      |      |      |
|-------------|------|------|------|-------------|------|------|------|-------------|------|------|------|-------------|------|------|------|
| 31          | 30   | 29   | 28   | 27          | 26   | 25   | 24   | 23          | 22   | 21   | 20   | 19          | 18   | 17   | 16   |
| Res.        | Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res.        | Res. | Res. | Res. |
|             |      |      |      |             |      |      |      |             |      |      |      |             |      |      |      |
| 15          | 14   | 13   | 12   | 11          | 10   | 9    | 8    | 7           | 6    | 5    | 4    | 3           | 2    | 1    | 0    |
| EXTI15[3:0] |      |      |      | EXTI14[3:0] |      |      |      | EXTI13[3:0] |      |      |      | EXTI12[3:0] |      |      |      |
| rw          | rw   | rw   | rw   | rw          | rw   | rw   | rw   | rw          | rw   | rw   | rw   | rw          | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **EXTI15[3:0]**: EXTI 15 configuration bits (EXTI15[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI15 external interrupt.

0000: PA[15] pin  
 0001: PB[15] pin  
 0010: PC[15] pin  
 0011: PD[15] pin  
 0100: PE[15] pin  
 0101: PF[15] pin  
 0110: PG[15] pin  
 0111: PH[15] pin (only on STM32L49x/L4Ax devices)  
 1000: Reserved

Bits 11:8 **EXTI14[3:0]**: EXTI 14 configuration bits (EXTI14[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI14 external interrupt.

0000: PA[14] pin  
 0001: PB[14] pin  
 0010: PC[14] pin  
 0011: PD[14] pin  
 0100: PE[14] pin  
 0101: PF[14] pin  
 0110: PG[14] pin  
 0111: PH[14] pin (only on STM32L49x/L4Ax devices)  
 1000: Reserved

Bits 7:4 **EXTI13[3:0]**: EXTI 13 configuration bits (EXTI13[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI13 external interrupt.

0000: PA[13] pin  
 0001: PB[13] pin  
 0010: PC[13] pin  
 0011: PD[13] pin  
 0100: PE[13] pin  
 0101: PF[13] pin  
 0110: PG[13] pin  
 0111: PH[13] pin (only on STM32L49x/L4Ax devices)  
 1000: Reserved

Bits 3:0 **EXTI12[3:0]**: EXTI 12 configuration bits (EXTI12[3]) is only available on STM32L49x/L4Ax)

These bits are written by software to select the source input for the EXTI12 external interrupt.

0000: PA[12] pin

0001: PB[12] pin

0010: PC[12] pin

0011: PD[12] pin

0100: PE[12] pin

0101: PF[12] pin

0110: PG[12] pin

0111: PH[12] pin (only on STM32L49x/L4Ax devices)

1000: Reserved

*Note:* Some of the I/O pins mentioned in the above register may not be available on small packages.

## 9.2.7 SYSCFG SRAM2 control and status register (SYSCFG\_SCSR)

Address offset: 0x18

System reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |              |             |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|--------------|-------------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17           | 16          |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.         | Res.        |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |              |             |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1            | 0           |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SRAM2<br>BSY | SRAM2<br>ER |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | r            | rw          |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SRAM2BSY**: SRAM2 busy by erase operation

0: No SRAM2 erase operation is on going.

1: SRAM2 erase operation is on going.

Bit 0 **SRAM2ER**: SRAM2 Erase

Setting this bit starts a hardware SRAM2 erase operation. This bit is automatically cleared at the end of the SRAM2 erase operation.

*Note:* This bit is write-protected: setting this bit is possible only after the correct key sequence is written in the SYSCFG\_SKR register.

## 9.2.8 SYSCFG configuration register 2 (SYSCFG\_CFGR2)

Address offset: 0x1C

System reset value: 0x0000 0000

|      |      |      |      |      |      |      |       |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|-------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24    | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |       |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8     | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | SPF   | Res. | Res. | Res. | Res. | ECCL | PVDL | SPL  | CLL  |
|      |      |      |      |      |      |      | rc_w1 |      |      |      |      | rs   | rs   | rs   | rs   |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SPF**: SRAM2 parity error flag

This bit is set by hardware when an SRAM2 parity error is detected. It is cleared by software by writing '1'.

0: No SRAM2 parity error detected

1: SRAM2 parity error detected

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **ECCL**: ECC Lock

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the Flash ECC error connection to TIM1/8/15/16/17 Break input.

0: ECC error disconnected from TIM1/8/15/16/17 Break input.

1: ECC error connected to TIM1/8/15/16/17 Break input.

Bit 2 **PVDL**: PVD lock enable bit

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the PVD connection to TIM1/8/15/16/17 Break input, as well as the PVDE and PLS[2:0] in the PWR\_CR2 register.

0: PVD interrupt disconnected from TIM1/8/15/16/17 Break input. PVDE and PLS[2:0] bits can be programmed by the application.

1: PVD interrupt connected to TIM1/8/15/16/17 Break input, PVDE and PLS[2:0] bits are read only.

Bit 1 **SPL**: SRAM2 parity lock bit

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the SRAM2 parity error signal connection to TIM1/8/15/16/17 Break inputs.

0: SRAM2 parity error signal disconnected from TIM1/8/15/16/17 Break inputs

1: SRAM2 parity error signal connected to TIM1/8/15/16/17 Break inputs

Bit 0 **CLL**: Cortex<sup>®</sup>-M4 LOCKUP (Hardfault) output enable bit

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the connection of Cortex<sup>®</sup>-M4 LOCKUP (Hardfault) output to TIM1/8/15/16/17 Break input

0: Cortex<sup>®</sup>-M4 LOCKUP output disconnected from TIM1/8/15/16/17 Break inputs

1: Cortex<sup>®</sup>-M4 LOCKUP output connected to TIM1/8/15/16/17 Break inputs

## 9.2.9 SYSCFG SRAM2 write protection register (SYSCFG\_SWPR)

Address offset: 0x20

System reset value: 0x0000 0000

Bits 31:0 **PxWP**: SRAM2 page x write protection (x = 31 to 0)

These bits are set by software and cleared only by a system reset.

0: Write protection of SRAM2 page x is disabled.

1: Write protection of SRAM2 page x is enabled.

### 9.2.10 SYSCFG SRAM2 key register (SYSCFG\_SKR)

Address offset: 0x24

System reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |          |      |      |      |      |      |      |      |

|      |      |      |      |      |      |      |      | w        | w    | w    | w    | w    | w    | w    | w    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **KEY[7:0]**: SRAM2 write protection key for software erase

The following steps are required to unlock the write protection of the SRAM2ER bit in the SYSCFG\_CFGR2 register.

1. Write "0xCA" into Key[7:0]
2. Write "0x53" into Key[7:0]

Writing a wrong key reactivates the write protection.

### 9.2.11 SYSCFG SRAM2 write protection register 2 (SYSCFG\_SWPR2)

This register applies only to STM32L49x/L4Ax devices.

Address offset: 0x28

System reset value: 0x0000 0000

Bits 31:0 **PxWP**: SRAM2 page x write protection (x = 63 to 32)

These bits are set by software and cleared only by a system reset.

- 0: Write protection of SRAM2 page x is disabled.
- 1: Write protection of SRAM2 page x is enabled.

## 9.2.12 SYSCFG register map

The following table gives the SYSCFG register map and the reset values.

**Table 41. SYSCFG register map and reset values**

| Offset | Register                    | 31           | 30    | 29    | 28    | 27    | 26    | 25    | 24    | 23       | 22    | 21    | 20       | 19    | 18    | 17       | 16    | 15           | 14       | 13    | 12           | 11          | 10    | 9            | 8           | 7     | 6            | 5           | 4     | 3     | 2           | 1     | 0       |          |  |  |  |  |  |

1. This register applies only to STM32L49x/L4Ax devices.

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 10 Peripherals interconnect matrix

### 10.1 Introduction

Several peripherals have direct connections between them.

This allows autonomous communication and or synchronization between peripherals, saving CPU resources thus power supply consumption.

In addition, these hardware connections remove software latency and allow design of predictable system.

Depending on peripherals, these interconnections can operate in Run, Sleep, Low-power run and sleep, Stop 0, Stop 1 and Stop 2 modes.

### 10.2 Connection summary

Table 42. STM32L47x/L48x/L49x/L4Ax peripherals interconnect matrix<sup>(1) (2)</sup>

1. Numbers in table are links to corresponding detailed sub-section in [Section 10.3: Interconnection details](#).

2. The “-” symbol in grayed cells means no interconnect.

3. Not available on STM32L471 devices.

## 10.3 Interconnection details

### 10.3.1 From timer (TIM1/TIM2/TIM3/TIM4/TIM5/TIM8/TIM15/TIM16/TIM17) to timer (TIM1/TIM2/TIM3/TIM4/TIM5/TIM8/TIM15)

#### Purpose

Some of the TIMx timers are linked together internally for timer synchronization or chaining.

When one timer is configured in Master Mode, it can reset, start, stop or clock the counter of another timer configured in Slave Mode.

A description of the feature is provided in: [Section 31.3.19: Timer synchronization](#).

The modes of synchronization are detailed in:

- [Section 31.3.19: Timer synchronization](#) for advanced-control timers (TIM1/TIM8)
- [Section 31.3.18: Timers and external trigger synchronization](#) for general-purpose timers (TIM2/TIM3/TIM4/TIM5)
- [Section 32.5.19: External trigger synchronization \(TIM15 only\)](#) for general-purpose timer (TIM15)

### Triggering signals

The output (from Master) is on signal TIMx\_TRGO (and TIMx\_TRGO2 for TIM1/TIM8) following a configurable timer event.

The input (to slave) is on signals TIMx\_ITR0/ITR1/ITR2/ITR3

The input and output signals for TIM1/TIM8 are shown in [Figure 223: Advanced-control timer block diagram](#).

The possible master/slave connections are given in:

- [Table 198: TIMx internal trigger connection](#)
- [Table 203: TIMx internal trigger connection](#)
- [Table 206: TIMx Internal trigger connection](#)

### Active power mode

Run, Sleep, Low-power run, Low-power sleep.

## 10.3.2 From timer (TIM1/TIM2/TIM3/TIM4/TIM6/TIM8/TIM15) and EXTI to ADC (ADC1/ADC2/ADC3)

### Purpose

General-purpose timers (TIM2/TIM3/TIM4), basic timer (TIM6), advanced-control timers (TIM1/TIM8), general-purpose timer (TIM15) and EXTI can be used to generate an ADC triggering event.

TIMx synchronization is described in: [Section 30.3.5: Clock selection](#) (TIM1/TIM8).

ADC synchronization is described in: [Section 18.4.18: Conversion on external trigger and trigger polarity \(EXTSEL, EXTEN, JEXTSEL, JEXTEN\)](#).

### Triggering signals

The output (from timer) is on signal TIMx\_TRGO, TIMx\_TRGO2 or TIMx\_CCx event.

The input (to ADC) is on signal EXT[15:0], JEXT[15:0].

The connection between timers and ADCs is provided in:

- [Table 108: ADC1, ADC2 and ADC3 - External triggers for regular channels](#)
- [Table 109: ADC1, ADC2 and ADC3 - External trigger for injected channels](#)

### Active power mode

Run, Sleep, Low-power run, Low-power sleep.

### 10.3.3 From ADC (ADC1/ADC2/ADC3) to timer (TIM1/TIM8)

#### Purpose

ADC1/ADC2/ADC3 can provide trigger event through watchdog signals to advanced-control timers (TIM1/TIM8).

A description of the ADC analog watchdog setting is provided in: [Section 18.4.29: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTx, AWD\\_LTx, AWDx\)](#).

Trigger settings on the timer are provided in: [Section 30.3.4: External trigger input](#).

#### Triggering signals

The output (from ADC) is on signals ADCn\_AWDx\_OUT n = 1, 2, 3 (for ADC1, 2, 3) x = 1, 2, 3 (3 watchdog per ADC) and the input (to timer) on signal TIMx\_ETR (external trigger).

#### Active power mode

Run, Sleep, Low-power run, Low-power sleep.

### 10.3.4 From timer (TIM2/TIM4/TIM5/TIM6/TIM7/TIM8) and EXTI to DAC (DAC\_CH1/DAC\_CH2)

#### Purpose

General-purpose timers (TIM2/TIM4/TIM5), basic timers (TIM6, TIM7), advanced-control timers (TIM8) and EXTI can be used as triggering event to start a DAC conversion.

#### Triggering signals

The output (from timer) is on signal TIMx\_TRGO directly connected to corresponding DAC inputs.

Selection of input triggers on DAC is provided in [Section 19.4.6: DAC trigger selection](#) (single and dual mode).

#### Active power mode

Run, Sleep, Low-power run, Low-power sleep.

### 10.3.5 From timer (TIM1/TIM3/TIM4/TIM6/TIM7/TIM8/TIM16) and EXTI to DFSDM1

#### Purpose

General-purpose timers (TIM3/TIM4), basic timers (TIM6/TIM7), advanced-control timers (TIM1/TIM8), general-purpose timer (TIM16) and EXTI can be used to generate a triggering event on DFSDM1 module (on each possible data block DFSDM1\_FLT0/DFSDM1\_FLT1/DFSDM1\_FLT2/DFSDM1\_FLT3) and start an ADC conversion.

DFSDM triggered conversion feature is described in: [Section 24.4.15: Launching conversions](#).

**Triggering signals**

The output (from timer) is on signal TIMx\_TRGO/TIMx\_TRGO2 or TIM16\_OC1.

The input (on DFSDM1) is on signal DFSDM1\_INTRG[0:8].

The connection between timers, EXTI and DFSDM1 is provided in [Table 158: DFSDM triggers connection](#).

**Active power mode**

Run, Sleep, Low-power run, Low-power sleep.

**10.3.6 From DFSDM1 to timer (TIM1/TIM8/TIM15/TIM16/TIM17)****Purpose**

DFSDM1 can generate a timer break on advanced-control timers (TIM1/TIM8) and general-purpose timers (TIM15/TIM16/TIM17) when a watchdog is activated (minimum or maximum threshold value crossed by analog signal) or when a short-circuit detection is made.

DFSDM1 watchdog is described in [Section 24.4.10: Analog watchdog](#).

DFSDM1 short-circuit detection is described in [Section 24.4.11: Short-circuit detector](#).

Timer break is described in:

- [Section 30.3.16: Using the break function](#) (TIM1/TIM8)
- [Section 32.5.13: Using the break function](#) (TIM15/TIM16/TIM17)

**Triggering signals**

The output (from DFSDM1) is on signals dfsdm1\_break[0:3] directly connected to timer and 'Ored' with other break input signals of the timer.

**Active power mode**

Run, Sleep, Low-power run, Low-power sleep.

**10.3.7 From HSE, LSE, LSI, MSI, MCO, RTC to timer (TIM2/TIM15/TIM16/TIM17)****Purpose**

External clocks (HSE, LSE), internal clocks (LSI, MSI), microcontroller output clock (MCO), GPIO and RTC wakeup interrupt can be used as input to general-purpose timer (TIM15/16/17) channel 1.

This allows to calibrate the HSI16/MSI system clocks (with TIM15/TIM16 and LSE) or LSI (with TIM16 and HSE). This is also used to precisely measure LSI (with TIM16 and HSI16) or MSI (with TIM17 and HSI16) oscillator frequency.

When Low Speed External (LSE) oscillator is used, no additional hardware connections are required.

This feature is described in [Section 6.2.18: Internal/external clock measurement with TIM15/TIM16/TIM17](#).

External clock LSE can be used as input to general-purpose timers (TIM2) on TIM2\_ETR pin, see [Section 31.4.22: TIM2 option register 1 \(TIM2\\_OR1\)](#).

**Active power mode**

Run, Sleep, Low-power run, Low-power sleep.

**10.3.8 From RTC, COMP1, COMP2 to low-power timer (LPTIM1/LPTIM2)****Purpose**

RTC alarm A/B, RTC\_TAMP1/2/3 input detection, COMP1/2\_OUT can be used as trigger to start LPTIM counters (LPTIM1/2).

**Triggering signals**

This trigger feature is described in [Section 34.4.6: Trigger multiplexer](#) (and following sections).

The input selection is described in [Table 213: LPTIM1 external trigger connection](#).

**Active power mode**

Run, Sleep, Low-power run, Low-power sleep, Stop 0, Stop 1, Stop 2 (LPTIM1 only).

**10.3.9 From timer (TIM1/TIM2/TIM3/TIM8/TIM15) to comparators (COMP1/COMP2)****Purpose**

Advanced-control timers (TIM1/TIM8), general-purpose timers (TIM2/TIM3) and general-purpose timer (TIM15) can be used as blanking window input to COMP1/COMP2

The blanking function is described in [Section 22.3.7: Comparator output blanking function](#).

The blanking sources are given in:

- [Section 22.6.1: Comparator 1 control and status register \(COMP1\\_CSR\)](#) bits 20:18 BLANKING[2:0]
- [Section 22.6.2: Comparator 2 control and status register \(COMP2\\_CSR\)](#) bits 20:18 BLANKING[2:0]

**Triggering signals**

Timer output signal TIMx\_Ocx are the inputs to blanking source of COMP1/COMP2.

**Active power mode**

Run, Sleep, Low-power run, Low-power sleep.

**10.3.10 From ADC (ADC1) to ADC (ADC2)****Purpose**

ADC1 can be used as a “master” to trigger ADC2 “slave” start of conversion.

In dual ADC mode, the converted data of the master and slave ADCs can be read in parallel.

A description of dual ADC mode is provided in: [Section 18.4.31: Dual ADC modes](#).

**Triggering signals**

Internal to the ADCs.

**Active power mode**

Run, Sleep, Low-power run, Low-power sleep.

**10.3.11 From USB to timer (TIM2)****Purpose**

USB (OTG\_FS SOF) can generate a trigger to general-purpose timer (TIM2).

Connection of USB to TIM2 is described in [Table 203: TIMx internal trigger connection](#).

**Triggering signals**

Internal signal generated by USB FS Start Of Frame.

**Active power mode**

Run, Sleep.

**10.3.12 From internal analog source to ADC (ADC1/ADC2/ADC3) and OPAMP (OPAMP1/OPAMP2)****Purpose**

Internal temperature sensor ( $V_{TS}$ ) and  $V_{BAT}$  monitoring channel are connected to ADC1/ADC3 input channels.

Internal reference voltage ( $V_{REFINT}$ ) is connected to ADC1 input channels.

OPAMP1 and OPAMP2 outputs can be connected to ADC1 or ADC2 input channels through the GPIO.

DAC1\_OUT1 and DAC1\_OUT2 outputs can be connected to ADC2 or ADC3 input channel.

DAC1\_OUT1 can be connected to OPAMP1\_VINP.

DAC1\_OUT2 can be connected to OPAMP2\_VINP.

This is according:

- [Section 18.2: ADC main features](#)
- [Section 18.4.11: Channel selection \(SQRx, JSQRx\)](#)
- [Figure 68: ADC1 connectivity](#)
- [Figure 70: ADC3 connectivity](#)
- [Table 151: Operational amplifier possible connections](#)

**Active power mode**

Run, Sleep, Low-power run, Low-power sleep.

### 10.3.13 From comparators (COMP1/COMP2) to timers (TIM1/TIM2/TIM3/TIM8/TIM15/TIM16/TIM17)

#### Purpose

Comparators (COMP1/COMP2) output values can be connected to timers (TIM1/TIM2/TIM3/TIM8/TIM15/TIM16/TIM17) input captures or TIMx\_ETR signals.

The connection to ETR is described in [Section 30.3.4: External trigger input](#).

Comparators (COMP1/COMP2) output values can also generate break input signals for timers (TIM1/TIM8) on input pins TIMx\_BKIN or TIMx\_BKIN2 through GPIO alternate function selection using open drain connection of IO, see [Section 30.3.17: Bidirectional break inputs](#).

The possible connections are given in:

- [Section 30.4.23: TIM1 option register 1 \(TIM1\\_OR1\)](#)
- [Section 30.4.24: TIM8 option register 1 \(TIM8\\_OR1\)](#)
- [Section 30.4.28: TIM1 option register 2 \(TIM1\\_OR2\)](#)
- [Section 30.4.30: TIM8 option register 2 \(TIM8\\_OR2\)](#)
- [Section 31.4.22: TIM2 option register 1 \(TIM2\\_OR1\)](#)
- [Section 31.4.23: TIM3 option register 1 \(TIM3\\_OR1\)](#)
- [Section 31.4.24: TIM2 option register 2 \(TIM2\\_OR2\)](#)
- [Section 31.4.25: TIM3 option register 2 \(TIM3\\_OR2\)](#)
- [Section 32.3: TIM16/TIM17 main features](#)

#### Active power mode

Run, Sleep, Low-power run, Low-power sleep.

### 10.3.14 From system errors to timers (TIM1/TIM8/TIM15/TIM16/TIM17)

#### Purpose

CSS, CPU hardfault, RAM parity error, FLASH ECC double error detection, PVD can generate system errors in the form of timer break toward timers (TIM1/TIM8/TIM15/TIM16/TIM17).

The purpose of the break function is to protect power switches driven by PWM signals generated by the timers.

List of possible source of break are described in:

- [Section 30.3.16: Using the break function](#) (TIM1/TIM8)
- [Section 32.5.13: Using the break function](#) (TIM15/TIM16/TIM17)
- [Figure 334: TIM15 block diagram](#)
- [Figure 335: TIM16/TIM17 block diagram](#)

#### Active power mode

Run, Sleep, Low-power run, Low-power sleep.

### 10.3.15 From timers (TIM16/TIM17) to IRTIM

#### Purpose

General-purpose timer (TIM16/TIM17) output channel TIMx\_OC1 are used to generate the waveform of infrared signal output.

The functionality is described in [Section 35: Infrared interface \(IRTIM\)](#).

#### Active power mode

Run, Sleep, Low-power run, Low-power sleep.

### 10.3.16 From ADC (ADC1/ADC2/ADC3) to DFSDM (only for STM32L49x/L4Ax devices)

#### Purpose

Up to 3 internal ADC results can be directly connected through a parallel bus to DFSDM input in order to use DFSDM filtering capabilities.

The feature is described as part of DFSDM peripheral description in [Section 24.4.6: Parallel data inputs - Input from internal ADC](#)

The possible connections are given in:

- [Section 24.7.1: DFSDM channel y configuration register \(DFSDM\\_CHyCFGR1\)](#)
  - Bits 13:12 DATMPX[1:0]: Input data multiplexer for channel y
- [Section 24.7.5: DFSDM channel y data input register \(DFSDM\\_CHyDATINR\)](#)
  - Bits 31:16 INDAT0[15:0]: Input data for channel y or channel y+1
  - Bits 15:0 INDAT0[15:0]: Input data for channel y

#### Active power mode

Run, Sleep, Low-power run, Low-power sleep.

## 11 Direct memory access controller (DMA)

### 11.1 Introduction

The direct memory access (DMA) controller is a bus master and system peripheral.

The DMA is used to perform programmable data transfers between memory-mapped peripherals and/or memories, upon the control of an off-loaded CPU.

The DMA controller features a single AHB master architecture.

There are two instances of DMA, DMA1 and DMA2.

Each channel is dedicated to managing memory access requests from one or more peripherals. Each DMA includes an arbiter for handling the priority between DMA requests.

### 11.2 DMA main features

- Single AHB master
- Peripheral-to-memory, memory-to-peripheral, memory-to-memory and peripheral-to-peripheral data transfers
- Access, as source and destination, to on-chip memory-mapped devices such as flash memory, SRAM, and AHB and APB peripherals
- All DMA channels independently configurable:
  - Each channel is associated either with a DMA request signal coming from a peripheral, or with a software trigger in memory-to-memory transfers. This configuration is done by software.
  - Priority between the requests is programmable by software (four levels per channel: very high, high, medium, low) and by hardware in case of equality (such as request to channel 1 has priority over request to channel 2).
  - Transfer size of source and destination are independent (byte, half-word, word), emulating packing and unpacking. Source and destination addresses must be aligned on the data size.
  - Support of transfers from/to peripherals to/from memory with circular buffer management
  - Programmable number of data to be transferred: 0 to  $2^{16} - 1$
- Generation of an interrupt request per channel. Each interrupt request is caused from any of the three DMA events: transfer complete, half transfer, or transfer error.

## 11.3 DMA implementation

### 11.3.1 DMA1 and DMA2

DMA1 and DMA2 are implemented with the hardware configuration parameters shown in the table below.

**Table 43. DMA1 and DMA2 implementation<sup>(1)</sup>**

| Feature            | DMA1 | DMA2 |
|--------------------|------|------|
| Number of channels | 7    | 7    |

1. HASH related DMA channel is only applicable for STM32L4Ax devices. I2C4 related DMA channel is only applicable for STM32L49x/L4Ax devices.

### 11.3.2 DMA request mapping

#### DMA controller

The hardware requests from the peripherals (TIM1/2/3/4/5/6/7/8/15/16/17, ADC1/2/3, DAC\_CH1/2, SPI1/2/3, I2C1/2/3/4, SDMMC1, QUADSPI, SWPMI1, DFSDM1, SAI1/2, AES, HASH, DCMI, USART1/2/3, UART4/5 and LPUART1) are mapped to the DMA channels through the DMA\_CSELR channel selection register (see [Figure 29](#) and [Figure 30](#)).

The peripheral DMA requests can be independently activated/de-activated by programming the DMA control bit in the registers of the corresponding peripheral.

**Caution:** A same peripheral request can be assigned to two different channels only if the application ensures that these channels are not requested to be served at the same time. In other words, if two different channels receive a same asserted peripheral request at the same time, an unpredictable DMA hardware behavior occurs.

[Table 44](#) and [Table 45](#) list the DMA requests for each channel.

Figure 29. DMA1 request mapping

Figure 30. DMA2 request mapping

Table 44. DMA1 requests for each channel

| CxS[3:0] | Channel 1 | Channel 2 | Channel 3 | Channel 4   | Channel 5   | Channel 6   | Channel 7   |
|----------|-----------|-----------|-----------|-------------|-------------|-------------|-------------|
| 0000     | ADC1      | ADC2      | ADC3      | DFSDM1_FLT0 | DFSDM1_FLT1 | DFSDM1_FLT2 | DFSDM1_FLT3 |
| 0001     | -         | SPI1_RX   | SPI1_TX   | SPI2_RX     | SPI2_TX     | SAI2_A      | SAI2_B      |
| 0010     | -         | USART3_TX | USART3_RX | USART1_TX   | USART1_RX   | USART2_RX   | USART2_TX   |

Table 44. DMA1 requests for each channel (continued)

| CxS[3:0] | Channel 1             | Channel 2 | Channel 3             | Channel 4                         | Channel 5                                        | Channel 6             | Channel 7             |

## 11.4 DMA functional description

### 11.4.1 DMA block diagram

The DMA block diagram is shown in the figure below.

Figure 31. DMA block diagram

The DMA controller performs direct memory transfer by sharing the AHB system bus with other system masters. The bus matrix implements round-robin scheduling. DMA requests

may stop the CPU access to the system bus for a number of bus cycles, when CPU and DMA target the same destination (memory or peripheral).

According to its configuration through the AHB slave interface, the DMA controller arbitrates between the DMA channels and their associated received requests. The DMA controller also schedules the DMA data transfers over the single AHB port master.

The DMA controller generates an interrupt per channel to the interrupt controller.

### 11.4.2 DMA transfers

The software configures the DMA controller at channel level, in order to perform a block transfer, composed of a sequence of AHB bus transfers.

A DMA block transfer may be requested from a peripheral, or triggered by the software in case of memory-to-memory transfer.

After an event, the following steps of a single DMA transfer occur:

1. The peripheral sends a single DMA request signal to the DMA controller.
2. The DMA controller serves the request, depending on the priority of the channel associated to this peripheral request.
3. As soon as the DMA controller grants the peripheral, an acknowledge is sent to the peripheral by the DMA controller.
4. The peripheral releases its request as soon as it gets the acknowledge from the DMA controller.
5. Once the request is de-asserted by the peripheral, the DMA controller releases the acknowledge.

The peripheral may order a further single request and initiate another single DMA transfer.

The request/acknowledge protocol is used when a peripheral is either the source or the destination of the transfer. For example, in case of memory-to-peripheral transfer, the peripheral initiates the transfer by driving its single request signal to the DMA controller. The DMA controller reads then a single data in the memory and writes this data to the peripheral.

For a given channel *x*, a DMA block transfer consists of a repeated sequence of:

- a single DMA transfer, encapsulating two AHB transfers of a single data, over the DMA AHB bus master:
  - a single data read (byte, half-word, or word) from the peripheral data register or a location in the memory, addressed through an internal current peripheral/memory address register.  
The start address used for the first single transfer is the base address of the peripheral or memory, and is programmed in the DMA\_CPARx or DMA\_CMARx register.
  - a single data write (byte, half-word, or word) to the peripheral data register or a location in the memory, addressed through an internal current peripheral/memory address register.  
The start address used for the first transfer is the base address of the peripheral or memory, and is programmed in the DMA\_CPARx or DMA\_CMARx register.
- post-decrementing of the programmed DMA\_CNDTRx register  
This register contains the remaining number of data items to transfer (number of AHB 'read followed by write' transfers).

This sequence is repeated until DMA\_CNDTRx is null.

*Note:* The AHB master bus source/destination address must be aligned with the programmed size of the transferred single data to the source/destination.

### 11.4.3 DMA arbitration

The DMA arbiter manages the priority between the different channels.

When an active channel x is granted by the arbiter (hardware requested or software triggered), a single DMA transfer is issued (such as a AHB 'read followed by write' transfer of a single data). Then, the arbiter considers again the set of active channels and selects the one with the highest priority.

The priorities are managed in two stages:

- software: priority of each channel is configured in the DMA\_CCRx register, to one of the four different levels:
  - very high
  - high
  - medium
  - low
- hardware: if two requests have the same software priority level, the channel with the lowest index gets priority. For example, channel 2 gets priority over channel 4.

When a channel x is programmed for a block transfer in memory-to-memory mode, re arbitration is considered between each single DMA transfer of this channel x. Whenever there is another concurrent active requested channel, the DMA arbiter automatically alternates and grants the other highest-priority requested channel, which may be of lower priority than the memory-to-memory channel.

### 11.4.4 DMA channels

Each channel may handle a DMA transfer between a peripheral register located at a fixed address, and a memory address. The amount of data items to transfer is programmable. The register that contains the amount of data items to transfer is decremented after each transfer.

A DMA channel is programmed at block transfer level.

#### Programmable data sizes

The transfer sizes of a single data (byte, half-word, or word) to the peripheral and memory are programmable through, respectively, the PSIZE[1:0] and MSIZE[1:0] fields of the DMA\_CCRx register.

#### Pointer incrementation

The peripheral and memory pointers may be automatically incremented after each transfer, depending on the PINC and MINC bits of the DMA\_CCRx register.

If the **incremented mode** is enabled (PINC or MINC set to 1), the address of the next transfer is the address of the previous one incremented by 1, 2 or 4, depending on the data size defined in PSIZE[1:0] or MSIZE[1:0]. The first transfer address is the one programmed in the DMA\_CPARx or DMA\_CMARx register. During transfers, these registers keep the initially programmed value. The current transfer addresses (in the current internal peripheral/memory address register) are not accessible by software.

If the channel *x* is configured in **non-circular mode**, no DMA request is served after the last data transfer (once the number of single data to transfer reaches zero). The DMA channel must be disabled in order to reload a new number of data items into the DMA\_CNDTRx register.

*Note:* If the channel *x* is disabled, the DMA registers are not reset. The DMA channel registers (DMA\_CCRx, DMA\_CPARx and DMA\_CMARx) retain the initial values programmed during the channel configuration phase.

In **circular mode**, after the last data transfer, the DMA\_CNDTRx register is automatically reloaded with the initially programmed value. The current internal address registers are reloaded with the base address values from the DMA\_CPARx and DMA\_CMARx registers.

### Channel configuration procedure

The following sequence is needed to configure a DMA channel *x*:

1. Set the peripheral register address in the DMA\_CPARx register.  
The data is moved from/to this address to/from the memory after the peripheral event, or after the channel is enabled in memory-to-memory mode.
2. Set the memory address in the DMA\_CMARx register.  
The data is written to/read from the memory after the peripheral event or after the channel is enabled in memory-to-memory mode.
3. Configure the total number of data to transfer in the DMA\_CNDTRx register.  
After each data transfer, this value is decremented.
4. Configure the parameters listed below in the DMA\_CCRx register:
  - the channel priority
  - the data transfer direction
  - the circular mode
  - the peripheral and memory incremented mode
  - the peripheral and memory data size
  - the interrupt enable at half and/or full transfer and/or transfer error
5. Activate the channel by setting the EN bit in the DMA\_CCRx register.

A channel, as soon as enabled, may serve any DMA request from the peripheral connected to this channel, or may start a memory-to-memory block transfer.

*Note:* The two last steps of the channel configuration procedure may be merged into a single access to the DMA\_CCRx register, to configure and enable the channel.

### Channel state and disabling a channel

A channel *x* in the active state is an enabled channel (read DMA\_CCRx.EN = 1). An active channel *x* is a channel that must have been enabled by the software (DMA\_CCRx.EN set to 1) and afterwards with no occurred transfer error (DMA\_ISR.TEIFx = 0). In case there is a transfer error, the channel is automatically disabled by hardware (DMA\_CCRx.EN = 0).

The three following use cases may happen:

- Suspend and resume a channel

This corresponds to the two following actions:

- An active channel is disabled by software (writing DMA\_CCRx.EN = 0 whereas DMA\_CCRx.EN = 1).
- The software enables the channel again (DMA\_CCRx.EN set to 1) without reconfiguring the other channel registers (such as DMA\_CNDTRx, DMA\_CPARx and DMA\_CMARx).

This case is not supported by the DMA hardware, that does not guarantee that the remaining data transfers are performed correctly.

- Stop and abort a channel

If the application does not need any more the channel, this active channel can be disabled by software. The channel is stopped and aborted but the DMA\_CNDTRx register content may not correctly reflect the remaining data transfers versus the aborted source and destination buffer/register.

- Abort and restart a channel

This corresponds to the software sequence: disable an active channel, then reconfigure the channel and enable it again.

This is supported by the hardware if the following conditions are met:

- The application guarantees that, when the software is disabling the channel, a DMA data transfer is not occurring at the same time over its master port. For example, the application can first disable the peripheral in DMA mode, in order to ensure that there is no pending hardware DMA request from this peripheral.
- The software must operate separated write accesses to the same DMA\_CCRx register: First disable the channel. Second reconfigure the channel for a next block transfer including the DMA\_CCRx if a configuration change is needed. There are read-only DMA\_CCRx register fields when DMA\_CCRx.EN=1. Finally enable again the channel.

When a channel transfer error occurs, the EN bit of the DMA\_CCRx register is cleared by hardware. This EN bit cannot be set again by software to reactivate the channel x, until the TEIFx bit of the DMA\_ISR register is set.

### Circular mode (in memory-to-peripheral/peripheral-to-memory transfers)

The circular mode is available to handle circular buffers and continuous data flows (such as ADC scan mode). This feature is enabled using the CIRC bit in the DMA\_CCRx register.

*Note: The circular mode must not be used in memory-to-memory mode. Before enabling a channel in circular mode (CIRC = 1), the software must clear the MEM2MEM bit of the DMA\_CCRx register. When the circular mode is activated, the amount of data to transfer is automatically reloaded with the initial value programmed during the channel configuration phase, and the DMA requests continue to be served.*

*In order to stop a circular transfer, the software needs to stop the peripheral from generating DMA requests (such as quit the ADC scan mode), before disabling the DMA channel. The software must explicitly program the DMA\_CNDTRx value before starting/enabling a transfer, and after having stopped a circular transfer.*

### Memory-to-memory mode

The DMA channels may operate without being triggered by a request from a peripheral. This mode is called memory-to-memory mode, and is initiated by software.

If the MEM2MEM bit in the DMA\_CCRx register is set, the channel, if enabled, initiates transfers. The transfer stops once the DMA\_CNDTRx register reaches zero.

*Note: The memory-to-memory mode must not be used in circular mode. Before enabling a channel in memory-to-memory mode (MEM2MEM = 1), the software must clear the CIRC bit of the DMA\_CCRx register.*

### Peripheral-to-peripheral mode

Any DMA channel can operate in peripheral-to-peripheral mode:

- when the hardware request from a peripheral is selected to trigger the DMA channel  
This peripheral is the DMA initiator and paces the data transfer from/to this peripheral to/from a register belonging to another memory-mapped peripheral (this one being not configured in DMA mode).
- when no peripheral request is selected and connected to the DMA channel  
The software configures a register-to-register transfer by setting the MEM2MEM bit of the DMA\_CCRx register.

### Programming transfer direction, assigning source/destination

The value of the DIR bit of the DMA\_CCRx register sets the direction of the transfer, and consequently, it identifies the source and the destination, regardless the source/destination type (peripheral or memory):

- **DIR = 1** defines typically a memory-to-peripheral transfer. More generally, if DIR = 1:
  - The **source** attributes are defined by the DMA\_MARx register, the MSIZE[1:0] field, and MINC bit of the DMA\_CCRx register.  
Regardless of their usual naming, these 'memory' register, field, and bit are used to define the source peripheral in peripheral-to-peripheral mode.
  - The **destination** attributes are defined by the DMA\_PARx register, the PSIZE[1:0] field and the PINC bit of the DMA\_CCRx register.  
Regardless of their usual naming, these 'peripheral' register, field, and bit are used to define the destination memory in memory-to-memory mode.
- **DIR = 0** defines typically a peripheral-to-memory transfer. More generally, if DIR = 0:
  - The **source** attributes are defined by the DMA\_PARx register, the PSIZE[1:0] field and the PINC bit of the DMA\_CCRx register.  
Regardless of their usual naming, these 'peripheral' register, field, and bit are used to define the source memory in memory-to-memory mode.
  - The **destination** attributes are defined by the DMA\_MARx register, the MSIZE[1:0] field and the MINC bit of the DMA\_CCRx register.  
Regardless of their usual naming, these 'memory' register, field and bit are used to define the destination peripheral in peripheral-to-peripheral mode.

### 11.4.5 DMA data width, alignment, and endianness

When PSIZE[1:0] and MSIZE[1:0] are not equal, the DMA controller performs some data alignments as described in the table below.

**Table 46. Programmable data width and endian behavior (when PINC = MINC = 1)**

| Source port width (MSIZE if DIR = 1, else PSIZE) | Destination port width (PSIZE if DIR = 1, else MSIZE) | Number of data items to transfer (NDT) | Source content: address / data (DMA_CMARx if DIR = 1, else DMA_CPARx)    | DMA transfers                                                                                                                                                                                                                                        | Destination content: address / data (DMA_CPARx if DIR = 1, else DMA_CMARx) |

### Addressing AHB peripherals not supporting byte/half-word write transfers

When the DMA controller initiates an AHB byte or half-word write transfer, the data are duplicated on the unused lanes of the AHB master 32-bit data bus (HWDATA[31:0]).

When the AHB slave peripheral does not support byte or half-word write transfers and does not generate any error, the DMA controller writes the 32 HWDATA bits as shown in the two examples below:

- To write the half-word 0xABCD, the DMA controller sets the HWDATA bus to 0xABCDABCD with a half-word data size (HSIZE = HalfWord in the AHB master bus).
- To write the byte 0xAB, the DMA controller sets the HWDATA bus to 0xABABABAB with a byte data size (HSIZE = Byte in the AHB master bus).

Assuming the AHB/APB bridge is an AHB 32-bit slave peripheral that does not take into account the HSIZE data, any AHB byte or half-word transfer is changed into a 32-bit APB transfer as described below:

- An AHB byte write transfer of 0xB0 to one of the 0x0, 0x1, 0x2, or 0x3 addresses, is converted to an APB word write transfer of 0xB0B0B0B0 to the 0x0 address.
- An AHB half-word write transfer of 0xB1B0 to the 0x0 or 0x2 addresses is converted to an APB word write transfer of 0xB1B0B1B0 to the 0x0 address.

### 11.4.6 DMA error management

A DMA transfer error is generated when reading from or writing to a reserved address space. When a DMA transfer error occurs during a DMA read or write access, the faulty channel x is automatically disabled through a hardware clear of its EN bit in the corresponding DMA\_CCRx register.

The TEIFx bit of the DMA\_ISR register is set. An interrupt is then generated if the TEIE bit of the DMA\_CCRx register is set.

The EN bit of the DMA\_CCRx register cannot be set again by software (channel x reactivated) until the TEIFx bit of the DMA\_ISR register is cleared (by setting the CTEIFx bit of the DMA\_IFCR register).

When the software is notified with a transfer error over a channel, which involves a peripheral, the software has first to stop this peripheral in DMA mode, in order to disable any pending or future DMA request. Then software may normally reconfigure both DMA and the peripheral in DMA mode for a new transfer.

## 11.5 DMA interrupts

An interrupt can be generated on a half transfer, transfer complete or transfer error for each DMA channel x. Separate interrupt enable bits are available for flexibility.

**Table 47. DMA interrupt requests**

| Interrupt request   | Interrupt event                                                   | Event flag | Interrupt enable bit |
|---------------------|-------------------------------------------------------------------|------------|----------------------|
| Channel x interrupt | Half transfer on channel x                                        | HTIFx      | HTIEx                |
|                     | Transfer complete on channel x                                    | TCIFx      | TCIEx                |
|                     | Transfer error on channel x                                       | TEIFx      | TEIEx                |
|                     | Half transfer or transfer complete or transfer error on channel x | GIFx       | -                    |

## 11.6 DMA registers

Refer to [Section 1.2](#) for a list of abbreviations used in register descriptions.

The DMA registers have to be accessed by words (32-bit).

### 11.6.1 DMA interrupt status register (DMA\_ISR)

Address offset: 0x00

Reset value: 0x0000 0000

Every status bit is cleared by hardware when the software sets the corresponding clear bit or the corresponding global clear bit CGIFx, in the DMA\_IFCR register.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **TEIF7**: Transfer error (TE) flag for channel 7

0: No TE event  
1: A TE event occurred.

Bit 26 **HTIF7**: Half transfer (HT) flag for channel 7

0: No HT event  
1: An HT event occurred.

Bit 25 **TCIF7**: Transfer complete (TC) flag for channel 7

0: No TC event  
1: A TC event occurred.

Bit 24 **GIF7**: Global interrupt flag for channel 7

0: No TE, HT, or TC event  
1: A TE, HT, or TC event occurred.

- Bit 23 **TEIF6**: Transfer error (TE) flag for channel 6  
0: No TE event  
1: A TE event occurred.
- Bit 22 **HTIF6**: Half transfer (HT) flag for channel 6  
0: No HT event  
1: An HT event occurred.
- Bit 21 **TCIF6**: Transfer complete (TC) flag for channel 6  
0: No TC event  
1: A TC event occurred.
- Bit 20 **GIF6**: Global interrupt flag for channel 6  
0: No TE, HT, or TC event  
1: A TE, HT, or TC event occurred.
- Bit 19 **TEIF5**: Transfer error (TE) flag for channel 5  
0: No TE event  
1: A TE event occurred.
- Bit 18 **HTIF5**: Half transfer (HT) flag for channel 5  
0: No HT event  
1: An HT event occurred.
- Bit 17 **TCIF5**: Transfer complete (TC) flag for channel 5  
0: No TC event  
1: A TC event occurred.
- Bit 16 **GIF5**: global interrupt flag for channel 5  
0: No TE, HT, or TC event  
1: A TE, HT, or TC event occurred.
- Bit 15 **TEIF4**: Transfer error (TE) flag for channel 4  
0: No TE event  
1: A TE event occurred.
- Bit 14 **HTIF4**: Half transfer (HT) flag for channel 4  
0: No HT event  
1: An HT event occurred.
- Bit 13 **TCIF4**: Transfer complete (TC) flag for channel 4  
0: No TC event  
1: A TC event occurred.
- Bit 12 **GIF4**: global interrupt flag for channel 4  
0: No TE, HT, or TC event  
1: A TE, HT, or TC event occurred.
- Bit 11 **TEIF3**: Transfer error (TE) flag for channel 3  
0: No TE event  
1: A TE event occurred.
- Bit 10 **HTIF3**: Half transfer (HT) flag for channel 3  
0: No HT event  
1: An HT event occurred.
- Bit 9 **TCIF3**: Transfer complete (TC) flag for channel 3  
0: No TC event  
1: A TC event occurred.

- Bit 8 **GIF3**: Global interrupt flag for channel 3  
0: No TE, HT, or TC event  
1: A TE, HT, or TC event occurred.
- Bit 7 **TEIF2**: Transfer error (TE) flag for channel 2  
0: No TE event  
1: A TE event occurred.
- Bit 6 **HTIF2**: Half transfer (HT) flag for channel 2  
0: No HT event  
1: An HT event occurred.
- Bit 5 **TCIF2**: Transfer complete (TC) flag for channel 2  
0: No TC event  
1: A TC event occurred.
- Bit 4 **GIF2**: Global interrupt flag for channel 2  
0: No TE, HT, or TC event  
1: A TE, HT, or TC event occurred.
- Bit 3 **TEIF1**: Transfer error (TE) flag for channel 1  
0: No TE event  
1: A TE event occurred.
- Bit 2 **HTIF1**: Half transfer (HT) flag for channel 1  
0: No HT event  
1: An HT event occurred.
- Bit 1 **TCIF1**: Transfer complete (TC) flag for channel 1  
0: No TC event  
1: A TC event occurred.
- Bit 0 **GIF1**: Global interrupt flag for channel 1  
0: No TE, HT, or TC event  
1: A TE, HT, or TC event occurred.

## 11.6.2 DMA interrupt flag clear register (DMA\_IFCR)

Address offset: 0x04

Reset value: 0x0000 0000

Setting the global clear bit CGIFx of the channel x in this DMA\_IFCR register, causes the DMA hardware to clear the corresponding GIFx bit and any individual flag among TEIFx, HTIFx, TCIFx, in the DMA\_ISR register.

Setting any individual clear bit among CTEIFx, CHTIFx, CTCIFx in this DMA\_IFCR register, causes the DMA hardware to clear the corresponding individual flag and the global flag GIFx in the DMA\_ISR register, provided that none of the two other individual flags is set.

Writing 0 into any flag clear bit has no effect.

Bit 11 **CTEIF3**: Transfer error flag clear for channel 3

Bit 10 **CHTIF3**: Half transfer flag clear for channel 3

Bit 9 **CTCIF3**: Transfer complete flag clear for channel 3

Bit 8 **CGIF3**: Global interrupt flag clear for channel 3

Bit 7 **CTEIF2**: Transfer error flag clear for channel 2

Bit 6 **CHTIF2**: Half transfer flag clear for channel 2

Bit 5 **CTCIF2**: Transfer complete flag clear for channel 2

Bit 4 **CGIF2**: Global interrupt flag clear for channel 2

Bit 3 **CTEIF1**: Transfer error flag clear for channel 1

Bit 2 **CHTIF1**: Half transfer flag clear for channel 1

Bit 1 **CTCIF1**: Transfer complete flag clear for channel 1

Bit 0 **CGIF1**: Global interrupt flag clear for channel 1

### 11.6.3 DMA channel x configuration register (DMA\_CCRx)

Address offset:  $0x08 + 0x14 * (x - 1)$ , ( $x = 1$  to  $7$ )

Reset value: 0x0000 0000

The register fields/bits MEM2MEM, PL[1:0], MSIZE[1:0], PSIZE[1:0], MINC, PINC, and DIR are read-only when EN = 1.

The states of MEM2MEM and CIRC bits must not be both high at the same time.

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **MEM2MEM**: Memory-to-memory mode

0: Disabled

1: Enabled

*Note:* This bit is set and cleared by software. It must not be written when the channel is enabled ( $EN = 1$ ). It is read-only when the channel is enabled ( $EN = 1$ ).

Bits 13:12 **PL[1:0]**: Priority level

00: Low

01: Medium

10: High

11: Very high

*Note:* This bitfield is set and cleared by software. It must not be written when the channel is enabled ( $EN = 1$ ). It is read-only when the channel is enabled ( $EN = 1$ ).

Bits 11:10 **MSIZE[1:0]**: Memory size

Defines the data size of each DMA transfer to the identified memory.

In memory-to-memory mode, this bitfield identifies the memory source if DIR = 1 and the memory destination if DIR = 0.

In peripheral-to-peripheral mode, this bitfield identifies the peripheral source if DIR = 1 and the peripheral destination if DIR = 0.

00: 8 bits

01: 16 bits

10: 32 bits

11: Reserved

*Note: This bitfield is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is read-only when the channel is enabled (EN = 1).*

Bits 9:8 **PSIZE[1:0]**: Peripheral size

Defines the data size of each DMA transfer to the identified peripheral.

In memory-to-memory mode, this bitfield identifies the memory destination if DIR = 1 and the memory source if DIR = 0.

In peripheral-to-peripheral mode, this bitfield identifies the peripheral destination if DIR = 1 and the peripheral source if DIR = 0.

00: 8 bits

01: 16 bits

10: 32 bits

11: Reserved

*Note: This bitfield is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is read-only when the channel is enabled (EN = 1).*

Bit 7 **MINC**: Memory increment mode

Defines the increment mode for each DMA transfer to the identified memory.

In memory-to-memory mode, this bit identifies the memory source if DIR = 1 and the memory destination if DIR = 0.

In peripheral-to-peripheral mode, this bit identifies the peripheral source if DIR = 1 and the peripheral destination if DIR = 0.

0: Disabled

1: Enabled

*Note: This bit is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is read-only when the channel is enabled (EN = 1).*

Bit 6 **PINC**: Peripheral increment mode

Defines the increment mode for each DMA transfer to the identified peripheral.

In memory-to-memory mode, this bit identifies the memory destination if DIR = 1 and the memory source if DIR = 0.

In peripheral-to-peripheral mode, this bit identifies the peripheral destination if DIR = 1 and the peripheral source if DIR = 0.

0: Disabled

1: Enabled

*Note: This bit is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is read-only when the channel is enabled (EN = 1).*

Bit 5 **CIRC**: Circular mode

0: Disabled

1: Enabled

*Note: This bit is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is not read-only when the channel is enabled (EN = 1).*

**Bit 4 DIR:** Data transfer direction

This bit must be set only in memory-to-peripheral and peripheral-to-memory modes.

0: Read from peripheral

- Source attributes are defined by PSIZE and PINC, plus the DMA\_CPARx register. This is still valid in a memory-to-memory mode.
- Destination attributes are defined by MSIZE and MINC, plus the DMA\_CMARx register. This is still valid in a peripheral-to-peripheral mode.

1: Read from memory

- Destination attributes are defined by PSIZE and PINC, plus the DMA\_CPARx register. This is still valid in a memory-to-memory mode.
- Source attributes are defined by MSIZE and MINC, plus the DMA\_CMARx register. This is still valid in a peripheral-to-peripheral mode.

*Note: This bit is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is read-only when the channel is enabled (EN = 1).*

**Bit 3 TEIE:** Transfer error interrupt enable

0: Disabled

1: Enabled

*Note: This bit is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is not read-only when the channel is enabled (EN = 1).*

**Bit 2 HTIE:** Half transfer interrupt enable

0: Disabled

1: Enabled

*Note: This bit is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is not read-only when the channel is enabled (EN = 1).*

**Bit 1 TCIE:** Transfer complete interrupt enable

0: Disabled

1: Enabled

*Note: This bit is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is not read-only when the channel is enabled (EN = 1).*

**Bit 0 EN:** Channel enable

When a channel transfer error occurs, this bit is cleared by hardware. It can not be set again by software (channel x re-activated) until the TEIFx bit of the DMA\_ISR register is cleared (by setting the CTEIFx bit of the DMA\_IFCR register).

0: Disabled

1: Enabled

*Note: This bit is set and cleared by software.*

### 11.6.4 DMA channel x number of data to transfer register (DMA\_CNDTRx)

Address offset:  $0x0C + 0x14 * (x - 1)$ , ( $x = 1$  to  $7$ )

Reset value:  $0x0000\ 0000$

|           |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|-----------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31        | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.      | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|           |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15        | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| NDT[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rW        | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **NDT[15:0]**: Number of data to transfer ( $0$  to  $2^{16} - 1$ )

This bitfield is updated by hardware when the channel is enabled:

- It is decremented after each single DMA 'read followed by write' transfer, indicating the remaining amount of data items to transfer.
- It is kept at zero when the programmed amount of data to transfer is reached, if the channel is not in circular mode ( $CIRC = 0$  in the DMA\_CCRx register).
- It is reloaded automatically by the previously programmed value, when the transfer is complete, if the channel is in circular mode ( $CIRC = 1$ ).

If this bitfield is zero, no transfer can be served whatever the channel status (enabled or not).

*Note: This bitfield is set and cleared by software. It must not be written when the channel is enabled ( $EN = 1$ ). It is read-only when the channel is enabled ( $EN = 1$ ).*

### 11.6.5 DMA channel x peripheral address register (DMA\_CPARx)

Address offset:  $0x10 + 0x14 * (x - 1)$ , ( $x = 1$  to  $7$ )

Reset value:  $0x0000\ 0000$

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| PA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| PA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:0 **PA[31:0]**: Peripheral address

It contains the base address of the peripheral data register from/to which the data is read/written.

When PSIZE[1:0] = 01 (16 bits), bit 0 of PA[31:0] is ignored. Access is automatically aligned to a half-word address.

When PSIZE[1:0] = 10 (32 bits), bits 1 and 0 of PA[31:0] are ignored. Access is automatically aligned to a word address.

In memory-to-memory mode, this bitfield identifies the memory destination address if DIR = 1 and the memory source address if DIR = 0.

In peripheral-to-peripheral mode, this bitfield identifies the peripheral destination address if DIR = 1 and the peripheral source address if DIR = 0.

*Note: This bitfield is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is not read-only when the channel is enabled (EN = 1).*

### 11.6.6 DMA channel x memory address register (DMA\_CMARx)

Address offset:  $0x14 + 0x14 * (x - 1)$ , (x = 1 to 7)

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MA[31:0]**: Peripheral address

It contains the base address of the memory from/to which the data is read/written.

When MSIZE[1:0] = 01 (16 bits), bit 0 of MA[31:0] is ignored. Access is automatically aligned to a half-word address.

When MSIZE[1:0] = 10 (32 bits), bits 1 and 0 of MA[31:0] are ignored. Access is automatically aligned to a word address.

In memory-to-memory mode, this bitfield identifies the memory source address if DIR = 1 and the memory destination address if DIR = 0.

In peripheral-to-peripheral mode, this bitfield identifies the peripheral source address if DIR = 1 and the peripheral destination address if DIR = 0.

*Note: This bitfield is set and cleared by software. It must not be written when the channel is enabled (EN = 1). It is not read-only when the channel is enabled (EN = 1).*

### 11.6.7 DMA channel selection register (DMA\_CSELR)

Address offset: 0xA8

Reset value: 0x0000 0000

This register is used to manage the mapping of DMA channels as detailed in [Section 11.3.2: DMA request mapping](#).

|          |      |      |      |          |    |    |    |          |    |    |    |          |    |    |    |

Refer to [Section 2.2](#) for the register boundary addresses.

## 12 Chrom-ART Accelerator controller (DMA2D)

This section applies to STM32L49x/L4Ax devices only.

### 12.1 DMA2D introduction

The Chrom-ART Accelerator (DMA2D) is a specialized DMA dedicated to image manipulation. It can perform the following operations:

- fill a part or the whole of a destination image with a specific color
- copy a part or the whole of a source image into a part or the whole of a destination image
- copy a part or the whole of a source image into a part or the whole of a destination image with a pixel format conversion
- blend a part and/or two complete source images with different pixel format and copy the result into a part or the whole of a destination image with a different color format

All the classical color coding schemes are supported from 4-bit up to 32-bit per pixel with indexed or direct color mode. The DMA2D has its own dedicated memories for CLUTs (color look-up tables).

### 12.2 DMA2D main features

The main DMA2D features are:

- Single AHB master bus architecture
- AHB slave programming interface supporting 8/16/32-bit accesses (except for CLUT accesses which are 32-bit)
- User programmable working area size
- User programmable offset for sources and destination areas
- User programmable sources and destination addresses on the whole memory space
- Up to 2 sources with blending operation
- Alpha value can be modified (source value, fixed value or modulated value)
- User programmable source and destination color format
- Up to 11 color formats supported from 4-bit up to 32-bit per pixel with indirect or direct color coding
- 2 internal memories for CLUT storage in indirect color mode
- Automatic CLUT loading or CLUT programming via the CPU
- User programmable CLUT size
- Internal timer to control AHB bandwidth
- 4 operating modes: register-to-memory, memory-to-memory, memory-to-memory with pixel format conversion, and memory-to-memory with pixel format conversion and blending
- Area filling with a fixed color
- Copy from an area to another
- Copy with pixel format conversion between source and destination images

- Copy from two sources with independent color format and blending
- Abort and suspend of DMA2D operations
- Watermark interrupt on a user programmable destination line
- Interrupt generation on bus error or access conflict
- Interrupt generation on process completion

## 12.3 DMA2D functional description

### 12.3.1 DMA2D block diagram

The DMA2D controller performs direct memory transfer. As an AHB master, it can take the control of the AHB bus matrix to initiate AHB transactions.

The DMA2D can operate in the following modes:

- Register-to-memory
- Memory-to-memory
- Memory-to-memory with pixel format conversion
- Memory-to-memory with pixel format conversion and blending

The AHB slave port is used to program the DMA2D controller.

The block diagram of the DMA2D is shown in the figure below.

**Figure 32. DMA2D block diagram**

### 12.3.2 DMA2D control

The DMA2D controller is configured through the DMA2D control register (DMA2D\_CR).

The user application can perform the following operations:

- Select the operating mode.
- Enable/disable the DMA2D interrupt.
- Start/suspend/abort ongoing data transfers.

### 12.3.3 DMA2D foreground and background FIFOs

The DMA2D foreground (FG) FG FIFO and background (BG) FIFO fetch the input data to be copied and/or processed.

These FIFOs fetch the pixels according to the color format defined in their respective pixel format converter (PFC). They are programmed through a set of control registers:

- DMA2D foreground memory address register (DMA2D\_FGMAR)
- DMA2D foreground offset register (DMA2D\_FGOR)

- DMA2D background memory address register (DMA2D\_BGMAR)
- DMA2D background offset register (DMA2D\_BGBOR)
- DMA2D number of lines register (number of lines and pixel per lines) (DMA2D\_NLR)

When the DMA2D operates in register-to-memory mode, none of the FIFOs is activated.

When the DMA2D operates in memory-to-memory mode (no pixel format conversion nor blending operation), only the FG FIFO is activated and acts as a buffer.

When the DMA2D operates in memory-to-memory operation with pixel format conversion (no blending operation), the BG FIFO is not activated.

### 12.3.4 DMA2D foreground and background pixel format converter (PFC)

DMA2D foreground pixel format converter (PFC) and background pixel format converter perform the pixel format conversion to generate a 32-bit per pixel value. The PFC can also modify the alpha channel.

The first stage of the converter converts the color format. The original color format of the foreground pixel and background pixels are configured through the CM[3:0] bits of the DMA2D\_FGPFCCR and DMA2D\_BGPFCCR, respectively.

The supported input formats are given in the table below.

**Table 49. Supported color mode in input**

| CM[3:0] | Color mode |
|---------|------------|
| 0000    | ARGB8888   |
| 0001    | RGB888     |
| 0010    | RGB565     |
| 0011    | ARGB1555   |
| 0100    | ARGB4444   |
| 0101    | L8         |
| 0110    | AL44       |
| 0111    | AL88       |
| 1000    | L4         |
| 1001    | A8         |
| 1010    | A4         |

The color format is coded as follows:

- Alpha value field: transparency  
0xFF value corresponds to an opaque pixel and 0x00 to a transparent one.
- R field for Red
- G field for Green
- B field for Blue
- L field: luminance  
This field is the index to a CLUT to retrieve the three/four RGB/ARGB components.

If the original format is direct color mode (ARGB/RGB), the extension to 8 bits per channel is performed by copying the MSBs into the LSBs. This ensures a perfect linearity of the conversion.

If the original format is indirect color mode (L/AL), a CLUT is required and each pixel format converter is associated with a 256 entry 32-bit CLUT.

If the original format does not include an alpha channel, the alpha value is automatically set to 0xFF (opaque).

For the specific alpha mode A4 and A8, no color information is stored nor indexed. The color to be used for the image generation is fixed and is defined in the DMA2D\_FGCOLR for foreground pixels and in the DMA2D\_BGCOLR register for background pixels.

The order of the fields in the system memory is defined in the table below.

**Table 50. Data order in memory**

| Color Mode | @ + 3                                                      | @ + 2                                    | @ + 1                                                      | @ + 0                                    |

| L4         | L <sub>7</sub> [3:0]L <sub>6</sub> [3:0]                   | L <sub>5</sub> [3:0]L <sub>4</sub> [3:0] | L <sub>3</sub> [3:0]L <sub>2</sub> [3:0]                   | L <sub>1</sub> [3:0]L <sub>0</sub> [3:0] |
| A8         | A <sub>3</sub> [7:0]                                       | A <sub>2</sub> [7:0]                     | A <sub>1</sub> [7:0]                                       | A <sub>0</sub> [7:0]                     |
| A4         | A <sub>7</sub> [3:0]A <sub>6</sub> [3:0]                   | A <sub>5</sub> [3:0]A <sub>4</sub> [3:0] | A <sub>3</sub> [3:0]A <sub>2</sub> [3:0]                   | A <sub>1</sub> [3:0]A <sub>0</sub> [3:0] |

The 24-bit RGB888 aligned on 32 bits is supported through the ARGB8888 mode.

Once the 32-bit value is generated, the alpha channel can be modified according to AM[1:0] in DMA2D\_FGPFCCR/DMA2D\_BGPFCCR registers as shown in the table below.

The alpha channel can be:

- kept as it is (no modification)
- replaced by the ALPHA[7:0] value of DMA2D\_FGPFCCR/DMA2D\_BGPFCCR
- replaced by the original alpha value multiplied by the ALPHA[7:0] value of DMA2D\_FGPFCCR/DMA2D\_BGPFCCR divided by 255.

Table 51. Alpha mode configuration

| AM[1:0] | Alpha mode                                                                |
|---------|---------------------------------------------------------------------------|
| 00      | No modification                                                           |
| 01      | Replaced by value in DMA2D_xxPFCCR                                        |
| 10      | Replaced by original value multiplied by the value in DMA2D_xxPFCCR / 255 |
| 11      | Reserved                                                                  |

*Note:* To support the alternate format, the incoming alpha value can be inverted setting AI in DMA2D\_FGPFCCR/DMA2D\_BGPFCCR registers. This applies also to the Alpha value stored in the DMA2D\_FGPFCCR/DMA2D\_BGPFCCR and in the CLUT.

The R and B fields can also be swapped setting RBS in DMA2D\_FGPFCCR/DMA2D\_BGPFCCR registers. This applies also to the RGB order used in the CLUT and in the DMA2D\_FGCOLR/DMA2D\_BGCOLR registers.

### 12.3.5 DMA2D foreground and background CLUT interface

The CLUT interface manages the CLUT memory access and the automatic loading of the CLUT.

Three access types are possible:

- CLUT read by the PFC during pixel format conversion operation
- CLUT accessed through the AHB slave port when the CPU is reading or writing data into the CLUT
- CLUT written through the AHB master port when an automatic loading of the CLUT is performed

The CLUT memory loading can be done in two different ways:

- Automatic loading
 

The following sequence must be followed to load the CLUT:

  - a) Program the CLUT address in DMA2D\_FGCMAR (foreground CLUT) or DMA2D\_BGCMAR (background CLUT).
  - b) Program the CLUT size with CS[7:0] in DMA2D\_FGPFCCR (foreground CLUT) or DMA2D\_BGPFCCR (background CLUT).
  - c) Set the START bit in DMA2D\_FGPFCCR (foreground CLUT) or DMA2D\_BGPFCCR (background CLUT) to start the transfer. During this automatic loading process, the CLUT is not accessible by the CPU. If a conflict occurs, a CLUT access error interrupt is raised assuming CAEIE = 1 in DMA2D\_CR.
- Manual loading
 

The application has to program the CLUT manually through the DMA2D AHB slave port to which the local CLUT memory is mapped. The foreground CLUT (FGCLUT) is located at address offset 0x0400 and the background CLUT (BGCLUT) at address offset 0x0800.

The CLUT format is 24 or 32 bits. It is configured through the CCM bit in DMA2D\_FGPFCCR (foreground CLUT) or DMA2D\_BGPFCCR (background CLUT) as shown in the table below.

**Table 52. Supported CLUT color mode**

| CCM | CLUT color mode |
|-----|-----------------|
| 0   | 32-bit ARGB8888 |
| 1   | 24-bit RGB888   |

The way the CLUT data are organized in the system memory is specified in the table below.

**Table 53. CLUT data order in system memory**

| CLUT color mode | @ + 3                | @ + 2                | @ + 1                | @ + 0                |
|-----------------|----------------------|----------------------|----------------------|----------------------|
| ARGB8888        | A <sub>0</sub> [7:0] | R <sub>0</sub> [7:0] | G <sub>0</sub> [7:0] | B <sub>0</sub> [7:0] |
| RGB888          | B <sub>1</sub> [7:0] | R <sub>0</sub> [7:0] | G <sub>0</sub> [7:0] | B <sub>0</sub> [7:0] |
|                 | G <sub>2</sub> [7:0] | B <sub>2</sub> [7:0] | R <sub>1</sub> [7:0] | G <sub>1</sub> [7:0] |
|                 | R <sub>3</sub> [7:0] | G <sub>3</sub> [7:0] | B <sub>3</sub> [7:0] | R <sub>2</sub> [7:0] |

### 12.3.6 DMA2D blender

The DMA2D blender blends the source pixels by pair to compute the resulting pixel.

The blending is performed according to the following equation:

$$\text{with } \alpha_{\text{Mult}} = \frac{\alpha_{\text{FG}} \cdot \alpha_{\text{BG}}}{255}$$

$$\alpha_{\text{OUT}} = \alpha_{\text{FG}} + \alpha_{\text{BG}} - \alpha_{\text{Mult}}$$

$$C_{\text{OUT}} = \frac{C_{\text{FG}} \cdot \alpha_{\text{FG}} + C_{\text{BG}} \cdot \alpha_{\text{BG}} - C_{\text{BG}} \cdot \alpha_{\text{Mult}}}{\alpha_{\text{OUT}}} \quad \text{with } C = R \text{ or } G \text{ or } B$$

*Division is rounded to the nearest lower integer*

No configuration register is required by the blender. The blender use depends on the DMA2D operating mode defined by MODE[1:0] in DMA2D\_CR.

### 12.3.7 DMA2D output PFC

The output PFC performs the pixel format conversion from 32 bits to the output format defined by CM[2:0] in DMA2D\_OPFCCR.

The supported output formats are given in the table below.

**Table 54. Supported color mode in output**

| CM[2:0] | Color mode |
|---------|------------|
| 000     | ARGB8888   |
| 001     | RGB888     |
| 010     | RGB565     |
| 011     | ARGB1555   |
| 100     | ARGB4444   |

*Note:* To support the alternate format, the calculated alpha value is inverted setting AI bit in DMA2D\_OPFCCR. This applies also to the alpha value used in DMA2D\_OCOLR.  
The R and B fields can also be swapped setting RBS in DMA2D\_OPFCCR. This applies also to the RGB order used in DMA2D\_OCOLR.

### 12.3.8 DMA2D output FIFO

The output FIFO programs the pixels according to the color format defined in the output PFC.

The destination area is defined through a set of control registers:

- DMA2D output memory address register (DMA2D\_OMAR)
- DMA2D output offset register (DMA2D\_OOR)
- DMA2D number of lines register (number of lines and pixel per lines) (DMA2D\_NLR)

If the DMA2D operates in register-to-memory mode, the configured output rectangle is filled by the color specified in DMA2D\_OCOLR which contains a fixed 32-, 24-, or 16-bit value. The format is selected by CM[2:0] in DMA2D\_OPFCCR.

The data are stored into the memory in the order defined in the table below.

**Table 55. Data order in memory**

| Color mode | @ + 3                                                      | @ + 2                                    | @ + 1                                                      | @ + 0                                    |
|------------|------------------------------------------------------------|------------------------------------------|------------------------------------------------------------|------------------------------------------|
| ARGB8888   | A <sub>0</sub> [7:0]                                       | R <sub>0</sub> [7:0]                     | G <sub>0</sub> [7:0]                                       | B <sub>0</sub> [7:0]                     |
| RGB888     | B <sub>1</sub> [7:0]                                       | R <sub>0</sub> [7:0]                     | G <sub>0</sub> [7:0]                                       | B <sub>0</sub> [7:0]                     |
|            | G <sub>2</sub> [7:0]                                       | B <sub>2</sub> [7:0]                     | R <sub>1</sub> [7:0]                                       | G <sub>1</sub> [7:0]                     |
|            | R <sub>3</sub> [7:0]                                       | G <sub>3</sub> [7:0]                     | B <sub>3</sub> [7:0]                                       | R <sub>2</sub> [7:0]                     |
| RGB565     | R <sub>1</sub> [4:0]G <sub>1</sub> [5:3]                   | G <sub>1</sub> [2:0]B <sub>1</sub> [4:0] | R <sub>0</sub> [4:0]G <sub>0</sub> [5:3]                   | G <sub>0</sub> [2:0]B <sub>0</sub> [4:0] |
| ARGB1555   | A <sub>1</sub> [0]R <sub>1</sub> [4:0]G <sub>1</sub> [4:3] | G <sub>1</sub> [2:0]B <sub>1</sub> [4:0] | A <sub>0</sub> [0]R <sub>0</sub> [4:0]G <sub>0</sub> [4:3] | G <sub>0</sub> [2:0]B <sub>0</sub> [4:0] |
| ARGB4444   | A <sub>1</sub> [3:0]R <sub>1</sub> [3:0]                   | G <sub>1</sub> [3:0]B <sub>1</sub> [3:0] | A <sub>0</sub> [3:0]R <sub>0</sub> [3:0]                   | G <sub>0</sub> [3:0]B <sub>0</sub> [3:0] |

The RGB888 aligned on 32 bits is supported through the ARGB8888 mode.

### 12.3.9 DMA2D AHB master port timer

An 8-bit timer is embedded into the AHB master port to provide an optional limitation of the bandwidth on the crossbar.

This timer is clocked by the AHB clock and counts a dead time between two consecutive accesses. This limits the bandwidth availability.

The timer enabling and the dead time value are configured through the AHB master port timer configuration register (DMA2D\_AMPTCR).

### 12.3.10 DMA2D transactions

DMA2D transactions consist of a sequence of a given number of data transfers. The number of data and the width can be programmed by software.

Each DMA2D data transfer is composed of up to four steps:

1. Data loading from the memory location pointed by DMA2D\_FGMAR and pixel format conversion as defined in DMA2D\_FGCR
2. Data loading from a memory location pointed by DMA2D\_BGMAR and pixel format conversion as defined in DMA2D\_BGCR
3. Blending of all retrieved pixels according to the alpha channels resulting of the PFC operation on alpha values
4. Pixel format conversion of the resulting pixels according to DMA2D\_OCR and programming of the data to the memory location addressed through DMA2D\_OMAR

### 12.3.11 DMA2D configuration

Both source and destination data transfers can target peripherals and memories in the whole 4 Gbyte memory area, at addresses ranging between 0x0000 0000 and 0xFFFF FFFF.

The DMA2D can operate in any of the following modes selected through MODE[1:0] in DMA2D\_CR:

- Register-to-memory
- Memory-to-memory
- Memory-to-memory with PFC
- Memory-to-memory with PFC and blending

#### Register-to-memory

The register-to-memory mode is used to fill a user defined area with a predefined color.

The color format is set in DMA2D\_OPFCCR.

The DMA2D does not perform any data fetching from any source. It just writes the color defined in DMA2D\_OCOLR to the area located at the address pointed by DMA2D\_OMAR, and defined in DMA2D\_NLR and DMA2D\_OOR.

### Memory-to-memory

In memory-to-memory mode, the DMA2D does not perform any graphical data transformation. The foreground input FIFO acts as a buffer and the data are transferred from the source memory location defined in DMA2D\_FGMAR to the destination memory location pointed by DMA2D\_OMAR.

The color mode programmed by CM[3:0] in DMA2D\_FGPFCCR defines the number of bits per pixel for both input and output.

The size of the area to be transferred is defined by DMA2D\_NLR and DMA2D\_FGOR for the source, and by DMA2D\_NLR and DMA2D\_OOR for the destination.

### Memory-to-memory with PFC

In this mode, the DMA2D performs a pixel format conversion of the source data and stores them in the destination memory location.

The size of the areas to be transferred are defined by DMA2D\_NLR and DMA2D\_FGOR for the source, and by DMA2D\_NLR and DMA2D\_OOR for the destination.

Data are fetched from the location defined in DMA2D\_FGMAR and processed by the foreground PFC. The original pixel format is configured through DMA2D\_FGPFCCR.

If the original pixel format is direct color mode, then the color channels are all expanded to 8 bits.

If the pixel format is indirect color mode, the associated CLUT has to be loaded into the CLUT memory.

The CLUT loading can be done automatically by following the sequence below:

1. Set the CLUT address into DMA2D\_FGCMAR.
2. Set the CLUT size with CS[7:0] bits in DMA2D\_FGPFCCR.
3. Set the CLUT format (24 or 32 bits) with CCM in DMA2D\_FGPFCCR.
4. Start the CLUT loading by setting START in DMA2D\_FGPFCCR.

Once the CLUT loading is complete, the CTCIF flag in DMA2D\_IFR is raised, and an interrupt is generated if CTCIE = 1 in DMA2D\_CR. The automatic CLUT loading process can not work in parallel with classical DMA2D transfers.

The CLUT can also be filled by the CPU or by any other master through the APB port. The access to the CLUT is not possible when a DMA2D transfer is ongoing and uses the CLUT (indirect color format).

In parallel to the color conversion process, the alpha value is added or changed depending on the value programmed in DMA2D\_FGPFCCR. If the original image does not have an alpha channel, a default alpha value of 0xFF is automatically added to obtain a fully opaque pixel. The alpha value is modified according to AM[1:0] in DMA2D\_FGPFCCR:

- It can be unchanged.
- It can be replaced by the value defined by ALPHA[7:0] in DMA2D\_FGPFCCR.
- It can be replaced by the original value multiplied by ALPHA[7:0] divided by 255.

The resulting 32-bit data are encoded by the OUT PFC into the format specified by CM[2:0] in DMA2D\_OPFCCR. The output pixel format cannot be the indirect mode since no CLUT generation process is supported.

The processed data are written into the destination memory location pointed by DMA2D\_OMAR.

### Memory-to-memory with PFC and blending

In this mode, two sources are fetched in the foreground and background FIFOs from the memory locations defined by DMA2D\_FGMAR and DMA2D\_BGMAR.

The two pixel format converters have to be configured as described in the memory-to-memory mode. Their configurations can be different as each pixel format converter is independent and has its own CLUT memory.

Once each pixel has been converted into 32 bits by its respective PFC, all pixels are blended according to the equation below:

$$\text{with } \alpha_{\text{Mult}} = \frac{\alpha_{\text{FG}} \cdot \alpha_{\text{BG}}}{255}$$

$$\alpha_{\text{OUT}} = \alpha_{\text{FG}} + \alpha_{\text{BG}} - \alpha_{\text{Mult}}$$

$$C_{\text{OUT}} = \frac{C_{\text{FG}} \cdot \alpha_{\text{FG}} + C_{\text{BG}} \cdot \alpha_{\text{BG}} - C_{\text{BG}} \cdot \alpha_{\text{Mult}}}{\alpha_{\text{OUT}}} \quad \text{with } C = R \text{ or } G \text{ or } B$$

*Division are rounded to the nearest lower integer*

The resulting 32-bit pixel value is encoded by the output PFC according to the specified output format, and the data are written into the destination memory location pointed by DMA2D\_OMAR.

### Configuration error detection

The DMA2D checks that the configuration is correct before any transfer. The configuration error interrupt flag is set by hardware when a wrong configuration is detected when a new transfer/automatic loading starts. An interrupt is then generated if CEIE = 1 in DMA2D\_CR.

The wrong configurations that can be detected are listed below:

- Foreground CLUT automatic loading: MA bits in DMA2D\_FGCMAR are not aligned with CCM in DMA2D\_FGPFCCR.
- Background CLUT automatic loading: MA bits in DMA2D\_BGCMAR are not aligned with CCM in DMA2D\_BGPFCCR.
- Memory transfer (except in register-to-memory mode): MA bits in DMA2D\_FGMAR are not aligned with CM in DMA2D\_FGPFCCR.
- Memory transfer (except in register-to-memory mode): CM bits in DMA2D\_FGPFCCR are invalid
- Memory transfer (except in register-to-memory mode and except in memory-to-memory mode with blending and fixed color FG): PL bits in DMA2D\_NLR are odd while CM in DMA2D\_FGPFCCR is A4 or L4.
- Memory transfer (except in register-to-memory mode): LO bits in DMA2D\_FGOR are odd while CM in DMA2D\_FGPFCCR is A4 or L4.
- Memory transfer (only in blending mode): MA bits in DMA2D\_BGMAR are not aligned

with CM in DMA2D\_BGPFCCR.

- Memory transfer (only in blending mode): CM bits in DMA2D\_BGPFCCR are invalid
- Memory transfer (only in blending mode): PL bits in DMA2D\_NLR odd while CM in DMA2D\_BGPFCCR is A4 or L4.
- Memory transfer (only in blending mode): LO bits in DMA2D\_BGOR are odd while CM in DMA2D\_BGPFCCR is A4 or L4.
- Memory transfer (except in memory-to-memory mode): MA bits in DMA2D\_OMAR are not aligned with CM bits in DMA2D\_OPFCCR.
- Memory transfer (except in memory to memory mode): CM bits in DMA2D\_OPFCCR are invalid.
- Memory transfer: NL = 0x0 in DMA2D\_NLR
- Memory transfer: PL = 0x0 in DMA2D\_NLR

### 12.3.12 DMA2D transfer control (start, suspend, abort and completion)

Once the DMA2D is configured, the transfer can be launched by setting START in DMA2D\_CR. Once the transfer is completed, START is automatically reset and TCIF flag in DMA2D\_ISR is raised. An interrupt can be generated if TCIE is set in DMA2D\_CR.

The user application can suspend the DMA2D at any time by setting SUSP in DMA2D\_CR. The transaction can then be aborted by setting ABORT in DMA2D\_CR, or can be restarted by resetting SUSP in DMA2D\_CR.

The user application can abort at any time an ongoing transaction by setting ABORT in DMA2D\_CR. In this case, the TCIF flag is not raised.

Automatic CLUT transfers can also be aborted or suspended by using ABORT or SUSP in DMA2D\_CR.

### 12.3.13 Watermark

A watermark can be programmed to generate an interrupt when the last pixel of a given line has been written to the destination memory area.

The line number is defined by LW[15:0] in DMA2D\_LWR.

When the last pixel of this line has been transferred, the TWIF flag in DMA2D\_ISR is raised, and an interrupt is generated if TWIE is set in DMA2D\_CR.

### 12.3.14 Error management

Two kind of errors can be triggered:

- AHB master port errors signaled by TEIF in DMA2D\_ISR
- conflicts caused by a CLUT access (CPU trying to access the CLUT while a CLUT loading or a DMA2D transfer is ongoing) signaled by CAEIF in DMA2D\_ISR.

Both flags are associated to their own interrupt enable flag in DMA2D\_CR to generate an interrupt if need be (TEIE and CAEIE).

### 12.3.15 AHB dead time

To limit the AHB bandwidth use, a dead time between two consecutive AHB accesses can be programmed.

This feature can be enabled by setting EN in DMA2D\_AMTCR.

The dead time value is stored into DT[7:0] in DMA2D\_AMTCR. This value represents the guaranteed minimum number of cycles between two consecutive transactions on the AHB bus.

The update of the dead time value while the DMA2D runs is taken into account for the next AHB transfer.

## 12.4 DMA2D interrupts

An interrupt can be generated on the following events:

- Configuration error
- CLUT transfer complete
- CLUT access error
- Transfer watermark reached
- Transfer complete
- Transfer error

Separate interrupt enable bits are available for flexibility.

**Table 56. DMA2D interrupt requests**

| Interrupt event        | Event flag | Enable control bit |
|------------------------|------------|--------------------|
| Configuration error    | CEIF       | CEIE               |
| CLUT transfer complete | CTCIF      | CTCIE              |
| CLUT access error      | CAEIF      | CAEIE              |
| Transfer watermark     | TWF        | TWIE               |
| Transfer complete      | TCIF       | TCIE               |
| Transfer error         | TEIF       | TEIE               |

## 12.5 DMA2D registers

### 12.5.1 DMA2D control register (DMA2D\_CR)

Address offset: 0x000

Reset value: 0x0000 0000

|      |      |      |       |       |      |      |      |      |      |      |      |      |       |           |       |
|------|------|------|-------|-------|------|------|------|------|------|------|------|------|-------|-----------|-------|
| 31   | 30   | 29   | 28    | 27    | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18    | 17        | 16    |
| Res. | Res. | Res. | Res.  | Res.  | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | MODE[1:0] |       |
|      |      |      |       |       |      |      |      |      |      |      |      |      |       | rw        | rw    |
| 15   | 14   | 13   | 12    | 11    | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2     | 1         | 0     |
| Res. | Res. | CEIE | CTCIE | CAEIE | TWIE | TCIE | TEIE | Res. | Res. | Res. | Res. | Res. | ABORT | SUSP      | START |
|      |      | rw   | rw    | rw    | rw   | rw   | rw   |      |      |      |      |      | rs    | rw        | rs    |

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **MODE[1:0]**: DMA2D mode

These bits are set and cleared by software. They cannot be modified while a transfer is ongoing.

00: Memory-to-memory (FG fetch only)

01: Memory-to-memory with PFC (FG fetch only with FG PFC active)

10: Memory-to-memory with blending (FG and BG fetch with PFC and blending)

11: Register-to-memory (no FG nor BG, only output stage active)

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **CEIE**: Configuration error interrupt enable

This bit is set and cleared by software.

0: CE interrupt disabled

1: CE interrupt enabled

Bit 12 **CTCIE**: CLUT transfer complete interrupt enable

This bit is set and cleared by software.

0: CTC interrupt disabled

1: CTC interrupt enabled

Bit 11 **CAEIE**: CLUT access error interrupt enable

This bit is set and cleared by software.

0: CAE interrupt disabled

1: CAE interrupt enabled

Bit 10 **TWIE**: Transfer watermark interrupt enable

This bit is set and cleared by software.

0: TW interrupt disabled

1: TW interrupt enabled

Bit 9 **TCIE**: Transfer complete interrupt enable

This bit is set and cleared by software.

0: TC interrupt disabled

1: TC interrupt enabled

Bit 8 **TEIE**: Transfer error interrupt enable

This bit is set and cleared by software.

0: TE interrupt disabled

1: TE interrupt enabled

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **ABORT**: Abort

This bit can be used to abort the current transfer. This bit is set by software and is automatically reset by hardware when the START bit is reset.

0: No transfer abort requested

1: Transfer abort requested

Bit 1 **SUSP**: Suspend

This bit can be used to suspend the current transfer. This bit is set and reset by software. It is automatically reset by hardware when the START bit is reset.

0: Transfer not suspended

1: Transfer suspended

Bit 0 **START**: Start

This bit can be used to launch the DMA2D according to the parameters loaded in the various configuration registers. This bit is automatically reset by the following events:

- at the end of the transfer
- when the data transfer is aborted by the user application (setting ABORT in DMA2D\_CR)
- when a data transfer error occurs
- when the data transfer has not started due to a configuration error or another transfer operation already ongoing (automatic CLUT loading).

## 12.5.2 DMA2D interrupt status register (DMA2D\_ISR)

Address offset: 0x004

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |       |       |      |      |      |

|      |      |      |      |      |      |      |      |      |      | r    | r     | r     | r    | r    | r    |

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **CEIF**: Configuration error interrupt flag

This bit is set when START in DMA2D\_CR, DMA2DFGPFCCR or DMA2D\_BGPFCCR is set and a wrong configuration has been programmed.

Bit 4 **CTCIF**: CLUT transfer complete interrupt flag

This bit is set when the CLUT copy from a system memory area to the internal DMA2D memory is complete.

Bit 3 **CAEIF**: CLUT access error interrupt flag

This bit is set when the CPU accesses the CLUT while the CLUT is being automatically copied from a system memory to the internal DMA2D.

Bit 2 **TWIF**: Transfer watermark interrupt flag

This bit is set when the last pixel of the watermarked line has been transferred.

Bit 1 **TCIF**: Transfer complete interrupt flag

This bit is set when a DMA2D transfer operation is complete (data transfer only).

Bit 0 **TEIF**: Transfer error interrupt flag

This bit is set when an error occurs during a DMA transfer (data transfer or automatic CLUT loading).

### 12.5.3 DMA2D interrupt flag clear register (DMA2D\_IFCR)

Address offset: 0x008

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |       |        |        |       |       |       |

|      |      |      |      |      |      |      |      |      |      | rc_w1 | rc_w1  | rc_w1  | rc_w1 | rc_w1 | rc_w1 |

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **CCEIF**: Clear configuration error interrupt flag

Programming this bit to 1 clears CEIF in DMA2D\_ISR.

Bit 4 **CCTCIF**: Clear CLUT transfer complete interrupt flag

Programming this bit to 1 clears CTCIF in DMA2D\_ISR.

Bit 3 **CAECIF**: Clear CLUT access error interrupt flag

Programming this bit to 1 clears CAEIF in DMA2D\_ISR.

Bit 2 **CTWIF**: Clear transfer watermark interrupt flag

Programming this bit to 1 clears TWIF in DMA2D\_ISR.

Bit 1 **CTCIF**: Clear transfer complete interrupt flag

Programming this bit to 1 clears TCIF in DMA2D\_ISR.

Bit 0 **CTEIF**: Clear Transfer error interrupt flag

Programming this bit to 1 clears TEIF in DMA2D\_ISR.

### 12.5.4 DMA2D foreground memory address register (DMA2D\_FGMAR)

Address offset: 0x00C

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MA[31:0]**: Memory address

This field contains the address of the data used for the foreground image. This register can only be written when data transfers are disabled. Once the data transfer has started, this register is read-only.

The address alignment must match the image format selected: for example, a 32-bit per pixel format must be 32-bit aligned, a 16-bit per pixel format must be 16-bit aligned and a 4-bit per pixel format must be 8-bit aligned.

### 12.5.5 DMA2D foreground offset register (DMA2D\_FGOR)

Address offset: 0x010

Reset value: 0x0000 0000

|      |      |          |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|----------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29       | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |          |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13       | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | LO[13:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |
|      |      | rw       | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **LO[13:0]**: Line offset

Line offset used for the foreground expressed in pixel. This value is used to generate the address. It is added at the end of each line to determine the starting address of the next line. These bits can only be written when data transfers are disabled. Once a data transfer has started, they become read-only.

If the image format is 4-bit per pixel, the line offset must be even.

### 12.5.6 DMA2D background memory address register (DMA2D\_BGMAR)

Address offset: 0x014

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MA[31:0]**: Memory address

This field contains the address of the data used for the background image. This register can only be written when data transfers are disabled. Once a data transfer has started, this register is read-only.

The address alignment must match the image format selected e.g. a 32-bit per pixel format must be 32-bit aligned, a 16-bit per pixel format must be 16-bit aligned and a 4-bit per pixel format must be 8-bit aligned.

### 12.5.7 DMA2D background offset register (DMA2D\_BGOR)

Address offset: 0x018

Reset value: 0x0000 0000

|      |      |          |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|----------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29       | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |          |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13       | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | LO[13:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |
|      |      | rw       | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **LO[13:0]**: Line offset

This field contains the line offset used for the background image (expressed in pixel).

This value is used for the address generation. It is added at the end of each line to determine the starting address of the next line.

These bits can only be written when data transfers are disabled. Once data transfer has started, they become read-only.

If the image format is 4-bit per pixel, the line offset must be even.

### 12.5.8 DMA2D foreground PFC control register (DMA2D\_FGPFCCR)

Address offset: 0x01C

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |      |      |       |     |         |      |         |    |
|------------|----|----|----|----|----|----|----|------|------|-------|-----|---------|------|---------|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23   | 22   | 21    | 20  | 19      | 18   | 17      | 16 |
| ALPHA[7:0] |    |    |    |    |    |    |    | Res. | Res. | RBS   | AI  | Res.    | Res. | AM[1:0] |    |
| rw         | rw | rw | rw | rw | rw | rw | rw |      |      | rw    | rw  |         |      | rw      | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7    | 6    | 5     | 4   | 3       | 2    | 1       | 0  |
| CS[7:0]    |    |    |    |    |    |    |    | Res. | Res. | START | CCM | CM[3:0] |      |         |    |
| rw         | rw | rw | rw | rw | rw | rw | rw |      |      | rs    | rw  | rw      | rw   | rw      | rw |

Bits 31:24 **ALPHA[7:0]**: Alpha value

These bits define a fixed alpha channel value which can replace the original alpha value or be multiplied by the original alpha value according to the alpha mode selected through the AM[1:0] bits.

These bits can only be written when data transfers are disabled. Once a transfer has started, they become read-only.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **RBS**: Red Blue swap

This bit is used to swap the R and B to support BGR or ABGR color formats. Once the transfer has started, this bit is read-only.

0: Regular mode (RGB or ARGB)

1: Swap mode (BGR or ABGR)

Bit 20 **AI**: Alpha Inverted

This bit inverts the alpha value. Once the transfer has started, this bit is read-only.

0: Regular alpha

1: Inverted alpha

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:16 **AM[1:0]**: Alpha mode

These bits select the alpha channel value to be used for the foreground image. They can only be written data the transfer are disabled. Once the transfer has started, they become read-only.

00: No modification of the foreground image alpha channel value

01: Replace original foreground image alpha channel value by ALPHA[7:0]

10: Replace original foreground image alpha channel value by ALPHA[7:0] multiplied with original alpha channel value

Other: Reserved

Bits 15:8 **CS[7:0]**: CLUT size

These bits define the size of the CLUT used for the foreground image. Once the CLUT transfer has started, this field is read-only.

The number of CLUT entries is equal to CS[7:0] + 1.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **START**: Start

This bit can be set to start the automatic loading of the CLUT. It is automatically reset:

- at the end of the transfer

- when the transfer is aborted by the user application by setting ABORT in DMA2D\_CR

- when a transfer error occurs

- when the transfer has not started due to a configuration error or another transfer operation already ongoing (data transfer or automatic background CLUT transfer)

Bit 4 **CCM**: CLUT color mode

This bit defines the color format of the CLUT. It can only be written when the transfer is disabled. Once the CLUT transfer has started, this bit is read-only.

0: ARGB8888

1: RGB888

Other: Reserved

Bits 3:0 **CM[3:0]**: Color mode

These bits defines the color format of the foreground image. They can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

0000: ARGB8888

0001: RGB888

0010: RGB565

0011: ARGB1555

0100: ARGB4444

0101: L8

0110: AL44

0111: AL88

1000: L4

1001: A8

1010: A4

Other: Reserved

### 12.5.9 DMA2D foreground color register (DMA2D\_FGCOLR)

Address offset: 0x020

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |           |    |    |    |    |    |    |    |
|------------|------|------|------|------|------|------|------|-----------|----|----|----|----|----|----|----|
| 31         | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|            |      |      |      |      |      |      |      | rw        | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| GREEN[7:0] |      |      |      |      |      |      |      | BLUE[7:0] |    |    |    |    |    |    |    |
| rw         | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw        | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **RED[7:0]**: Red value

These bits define the Red value for the A4 or A8 mode of the foreground image. They can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

Bits 15:8 **GREEN[7:0]**: Green value

These bits defines the Green value for the A4 or A8 mode of the foreground image. They can only be written when data transfers are disabled. Once the transfer has started, They are read-only.

Bits 7:0 **BLUE[7:0]**: Blue value

These bits defines the Blue value for the A4 or A8 mode of the foreground image. They can only be written when data transfers are disabled. Once the transfer has started, They are read-only.

### 12.5.10 DMA2D background PFC control register (DMA2D\_BGPFCCR)

Address offset: 0x024

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |      |      |       |     |         |      |         |    |
|------------|----|----|----|----|----|----|----|------|------|-------|-----|---------|------|---------|----|

| rw         | rw | rw | rw | rw | rw | rw | rw |      |      | rs    | rw  | rw      | rw   | rw      | rw |

Bits 31:24 **ALPHA[7:0]**: Alpha value

These bits define a fixed alpha channel value which can replace the original alpha value or be multiplied with the original alpha value according to the alpha mode selected with AM[1:0]. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **RBS**: Red Blue swap

This bit is used to swap the R and B to support BGR or ABGR color formats. Once the transfer has started, this bit is read-only.

- 0: Regular mode (RGB or ARGB)
- 1: Swap mode (BGR or ABGR)

Bit 20 **AI**: Alpha inverted

This bit inverts the alpha value. Once the transfer has started, this bit is read-only.

- 0: Regular alpha
- 1: Inverted alpha

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:16 **AM[1:0]**: Alpha mode

These bits define which alpha channel value to be used for the background image. They can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

- 00: No modification of the foreground image alpha channel value
- 01: Replace original background image alpha channel value by ALPHA[7:0]
- 10: Replace original background image alpha channel value by ALPHA[7:0] multiplied with original alpha channel value
- Other: Reserved

Bits 15:8 **CS[7:0]**: CLUT size

These bits define the size of the CLUT used for the BG. Once the CLUT transfer has started, this field is read-only.

The number of CLUT entries is equal to CS[7:0] + 1.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **START**: Start

This bit is set to start the automatic loading of the CLUT. This bit is automatically reset:

- at the end of the transfer
- when the transfer is aborted by the user application by setting ABORT in DMA2D\_CR
- when a transfer error occurs
- when the transfer has not started due to a configuration error or another transfer operation already ongoing (data transfer or automatic foreground CLUT transfer).

Bit 4 **CCM**: CLUT color mode

These bits define the color format of the CLUT. This register can only be written when the transfer is disabled. Once the CLUT transfer has started, this bit is read-only.

- 0: ARGB8888
- 1: RGB888
- Other: Reserved

Bits 3:0 **CM[3:0]**: Color mode

These bits define the color format of the foreground image. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

0000: ARGB8888

0001: RGB888

0010: RGB565

0011: ARGB1555

0100: ARGB4444

0101: L8

0110: AL44

0111: AL88

1000: L4

1001: A8

1010: A4

Other: Reserved

### 12.5.11 DMA2D background color register (DMA2D\_BGCOLR)

Address offset: 0x028

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |           |    |    |    |    |    |    |    |
|------------|------|------|------|------|------|------|------|-----------|----|----|----|----|----|----|----|
| 31         | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|            |      |      |      |      |      |      |      | rw        | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| GREEN[7:0] |      |      |      |      |      |      |      | BLUE[7:0] |    |    |    |    |    |    |    |
| rw         | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw        | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **RED[7:0]**: Red value

These bits define the Red value for the A4 or A8 mode of the background. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

Bits 15:8 **GREEN[7:0]**: Green value

These bits define the green value for the A4 or A8 mode of the background. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

Bits 7:0 **BLUE[7:0]**: Blue value

These bits define the blue value for the A4 or A8 mode of the background. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

### 12.5.12 DMA2D foreground CLUT memory address register (DMA2D\_FGCMAR)

Address offset: 0x02C

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MA[31:0]**: Memory address

This field contains the address of the data used for the CLUT address dedicated to the foreground image. This register can only be written when no transfer is ongoing. Once the CLUT transfer has started, this register is read-only.

If the foreground CLUT format is 32-bit, the address must be 32-bit aligned.

### 12.5.13 DMA2D background CLUT memory address register (DMA2D\_BGCMAR)

Address offset: 0x030

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MA[31:0]**: Memory address

This field contains the address of the data used for the CLUT address dedicated to the background image. This register can only be written when no transfer is ongoing. Once the CLUT transfer has started, this register is read-only.

If the background CLUT format is 32-bit, the address must be 32-bit aligned.

### 12.5.14 DMA2D output PFC control register (DMA2D\_OPFCCR)

Address offset: 0x034

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |         |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|---------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18      | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RBS  | AI   | Res. | Res.    | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      | rw   | rw   |      |         |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2       | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CM[2:0] |      |      |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw      | rw   | rw   |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **RBS**: Red Blue swap

This bit is used to swap the R and B to support BGR or ABGR color formats. Once the transfer has started, this bit is read-only.

0: Regular mode (RGB or ARGB)

1: Swap mode (BGR or ABGR)

Bit 20 **AI**: Alpha Inverted

This bit inverts the alpha value. Once the transfer has started, this bit is read-only.

0: Regular alpha

1: Inverted alpha

Bits 19:3 Reserved, must be kept at reset value.

Bits 2:0 **CM[2:0]**: Color mode

These bits define the color format of the output image. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

000: ARGB8888

001: RGB888

010: RGB565

011: ARGB1555

100: ARGB4444

Other: Reserved

### 12.5.15 DMA2D output color register (DMA2D\_OCOLR)

Address offset: 0x038

Reset value: 0x0000 0000

The same register is used to show the color values, with different formats depending on the color mode.

This register can only be written when transfers are disabled. Once the CLUT transfer started, this register is read-only.

ARGB8888 or RGB888 color mode

|            |     |     |     |     |     |     |     |           |     |     |     |     |     |     |     |
|------------|-----|-----|-----|-----|-----|-----|-----|-----------|-----|-----|-----|-----|-----|-----|-----|
| 31         | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| ALPHA[7:0] |     |     |     |     |     |     |     | RED[7:0]  |     |     |     |     |     |     |     |
| r/w        | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w       | r/w | r/w | r/w | r/w | r/w | r/w | r/w |
| 15         | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| GREEN[7:0] |     |     |     |     |     |     |     | BLUE[7:0] |     |     |     |     |     |     |     |
| r/w        | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w       | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:24 **ALPHA[7:0]**: Alpha channel value of the output color in ARGB8888 mode (otherwise reserved)

Bits 23:16 **RED[7:0]**: Red value of the output image in ARGB8888 or RGB888 mode

Bits 15:8 **GREEN[7:0]**: Green value of the output image in ARGB8888 or RGB888

Bits 7:0 **BLUE[7:0]**: Blue value of the output image in ARGB8888 or RGB888

### 12.5.16 DMA2D output color register [alternate] (DMA2D\_OCOLR)

Address offset: 0x038

Reset value: 0x0000 0000

The same register is used to show the color values, with different formats depending on the color mode.

This register can only be written when transfers are disabled. Once the CLUT transfer started, this register is read-only.

RGB565 color mode

|          |      |      |      |            |      |      |      |      |      |      |      |           |      |      |      |
|----------|------|------|------|------------|------|------|------|------|------|------|------|-----------|------|------|------|
| 31       | 30   | 29   | 28   | 27         | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19        | 18   | 17   | 16   |
| Res.     | Res. | Res. | Res. | Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. |
| 15       | 14   | 13   | 12   | 11         | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3         | 2    | 1    | 0    |
| RED[4:0] |      |      |      | GREEN[5:0] |      |      |      |      |      |      |      | BLUE[4:0] |      |      |      |
| r/w      | r/w  | r/w  | r/w  | r/w        | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w       | r/w  | r/w  | r/w  |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:11 **RED[4:0]**: Red value of the output image in RGB565 mode

Bits 10:5 **GREEN[5:0]**: Green value of the output image in RGB565 mode

Bits 4:0 **BLUE[4:0]**: Blue value of the output image in RGB565 mode

### 12.5.17 DMA2D output color register [alternate] (DMA2D\_OCOLR)

Address offset: 0x038

Reset value: 0x0000 0000

The same register is used to show the color values, with different formats depending on the color mode.

This register can only be written when transfers are disabled. Once the CLUT transfer started, this register is read-only.

ARGB1555 color mode

|      |      |          |      |      |      |            |      |      |      |           |      |      |      |      |      |
|------|------|----------|------|------|------|------------|------|------|------|-----------|------|------|------|------|------|
| 31   | 30   | 29       | 28   | 27   | 26   | 25         | 24   | 23   | 22   | 21        | 20   | 19   | 18   | 17   | 16   |

| MA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MA[31:0]**: Memory Address

This field contains the address of the data used for the output FIFO. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

The address alignment must match the image format selected e.g. a 32-bit per pixel format must be 32-bit aligned and a 16-bit per pixel format must be 16-bit aligned.

### 12.5.20 DMA2D output offset register (DMA2D\_OOR)

Address offset: 0x0040

Reset value: 0x0000 0000

|      |      |          |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **LO[13:0]**: Line offset

This field contains the line offset used for the output (expressed in pixels). This value is used for the address generation. It is added at the end of each line to determine the starting address of the next line. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

### 12.5.21 DMA2D number of line register (DMA2D\_NLR)

Address offset: 0x044

Reset value: 0x0000 0000

|          |      |          |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------|------|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31       | 30   | 29       | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| NL[15:0] |      |          |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw       | rw   | rw       | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **PL[13:0]**: Pixel per lines

Number of pixels per lines of the area to be transferred. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

If any of the input image format is 4-bit per pixel, pixel per lines must be even.

Bits 15:0 **NL[15:0]**: Number of lines

Number of lines of the area to be transferred. These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

### 12.5.22 DMA2D line watermark register (DMA2D\_LWR)

Address offset: 0x048

Reset value: 0x0000 0000

|          |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|----------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

| Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|          |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15       | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| LW[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rw       | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **LW[15:0]**: Line watermark

These bits allow the configuration of the line watermark for interrupt generation.

An interrupt is raised when the last pixel of the watermarked line has been transferred.

These bits can only be written when data transfers are disabled. Once the transfer has started, they are read-only.

### 12.5.23 DMA2D AHB master timer configuration register (DMA2D\_AMTCR)

Address offset: 0x04C

Reset value: 0x0000 0000

|         |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|---------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31      | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.    | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15      | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| DT[7:0] |      |      |      |      |      |      |      | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EN   |
| rw      | rw   | rw   | rw   | rw   | rw   | rw   | rw   |      |      |      |      |      |      |      | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **DT[7:0]**: Dead time

Dead time value in the AHB clock cycle inserted between two consecutive accesses on the AHB master port. These bits represent the minimum guaranteed number of cycles between two consecutive AHB accesses.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **EN**: Enable

Enables the dead time functionality.

### 12.5.24 DMA2D foreground CLUT (DMA2D\_FGCLUTx)

Address offset: 0x400 + 0x4 \* x, (x = 0 to 255)

Reset value: 0xFFFF XXXX

|            |    |    |    |    |    |    |    |           |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ALPHA[7:0] |    |    |    |    |    |    |    | RED[7:0]  |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw        | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| GREEN[7:0] |    |    |    |    |    |    |    | BLUE[7:0] |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw        | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **ALPHA[7:0]**: Alpha

Alpha value for index {x} for the foreground

Bits 23:16 **RED[7:0]**: Red

Red value for index {x} for the foreground

Bits 15:8 **GREEN[7:0]**: Green

Green value for index {x} for the foreground

Bits 7:0 **BLUE[7:0]**: Blue

Blue value for index {x} for the foreground

### 12.5.25 DMA2D background CLUT (DMA2D\_BGCLUTx)

Address offset:  $0x800 + 0x4 * x$ , ( $x = 0$  to  $255$ )

Reset value: 0xFFFF XXXX

|            |    |    |    |    |    |    |    |           |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ALPHA[7:0] |    |    |    |    |    |    |    | RED[7:0]  |    |    |    |    |    |    |    |
| rW         | rW | rW | rW | rW | rW | rW | rW | rW        | rW | rW | rW | rW | rW | rW | rW |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| GREEN[7:0] |    |    |    |    |    |    |    | BLUE[7:0] |    |    |    |    |    |    |    |
| rW         | rW | rW | rW | rW | rW | rW | rW | rW        | rW | rW | rW | rW | rW | rW | rW |

Bits 31:24 **ALPHA[7:0]**: Alpha

Alpha value for index {x} for the background

Bits 23:16 **RED[7:0]**: Red

Red value for index {x} for the background

Bits 15:8 **GREEN[7:0]**: Green

Green value for index {x} for the background

Bits 7:0 **BLUE[7:0]**: Blue

Blue value for index {x} for the background

### 12.5.26 DMA2D register map

Table 57. DMA2D register map and reset values

Refer to [Section 2.2](#) for the register boundary addresses.

## 13 Nested vectored interrupt controller (NVIC)

### 13.1 NVIC main features

- 82 (for STM32L47x/L48x devices), 91 (for STM32L49x/L4Ax devices) maskable interrupt channels (not including the sixteen Cortex<sup>®</sup>-M4 with FPU interrupt lines)
- 16 programmable priority levels (4 bits of interrupt priority are used)
- Low-latency exception and interrupt handling
- Power management control
- Implementation of System Control Registers

The NVIC and the processor core interface are closely coupled, which enables low latency interrupt processing and efficient processing of late arriving interrupts.

All interrupts including the core exceptions are managed by the NVIC. For more information on exceptions and NVIC programming, refer to the PM0214 programming manual for Cortex<sup>™</sup>-M4 products.

### 13.2 SysTick calibration value register

The SysTick calibration value is set to 0x4000270F, which gives a reference time base of 1 ms with the SysTick clock set to 10 MHz ( $\max f_{HCLK}/8$ ).

### 13.3 Interrupt and exception vectors

The grey rows in [Table 58](#) describe the vectors without specific position.

**Table 58. STM32L47x/L48x/L49x/L4Ax vector table**

| Position | Priority | Type of priority | Acronym                 | Description                                                                              | Address                      |

1. Available on STM32L4x5/L4x6 devices only.
2. Available on STM32L4x6 devices only.
3. Available on STM32L486/L4A6 devices only.
4. HASH available on STM32L4Ax devices only.

## 14 Extended interrupts and events controller (EXTI)

### 14.1 Introduction

The EXTI main features are as follows:

- Generation of up to 40 (STM32L47x/L48x devices), up to 41 (STM32L49x/L4Ax devices) event/interrupt requests
  - 26 configurable lines
  - 14 direct lines (STM32L47x/L48x devices), 15 direct lines (STM32L49x/L4Ax devices)
- Independent mask on each event/interrupt line
- Configurable rising or falling edge (configurable lines only)
- Dedicated status bit (configurable lines only)
- Emulation of event/interrupt requests (configurable lines only)

### 14.2 EXTI main features

The extended interrupts and events controller (EXTI) manages the external and internal asynchronous events/interrupts and generates the event request to the CPU/Interrupt Controller and a wake-up request to the Power Controller.

The EXTI allows the management of up to 40 (STM32L47x/L48x devices), up to 41 (STM32L49x/L4Ax devices) event lines which can wake up from the Stop 0 and Stop 1 modes. Not all events can wake up from the Stop 2 mode (refer to [Table 59: EXTI lines connections](#)).

The lines are either configurable or direct:

- The lines are configurable: the active edge can be chosen independently, and a status flag indicates the source of the interrupt. The configurable lines are used by the I/Os external interrupts, and by few peripherals.
- The lines are direct: they are used by some peripherals to generate a wakeup from Stop event or interrupt. The status flag is provided by the peripheral.

Each line can be masked independently for an interrupt or an event generation.

This controller also allows to emulate events or interrupts by software, multiplexed with the corresponding hardware event line, by writing to a dedicated register.

### 14.3 EXTI functional description

For the configurable interrupt lines, the interrupt line should be configured and enabled in order to generate an interrupt. This is done by programming the two trigger registers with the desired edge detection and by enabling the interrupt request by writing a '1' to the corresponding bit in the interrupt mask register. When the selected edge occurs on the interrupt line, an interrupt request is generated. The pending bit corresponding to the interrupt line is also set. This request is cleared by writing a '1' in the pending register.

For the direct interrupt lines, the interrupt is enabled by default in the interrupt mask register and there is no corresponding pending bit in the pending register.

To generate an event, the event line should be configured and enabled. This is done by programming the two trigger registers with the desired edge detection and by enabling the event request by writing a '1' to the corresponding bit in the event mask register. When the selected edge occurs on the event line, an event pulse is generated. The pending bit corresponding to the event line is not set.

For the configurable lines, an interrupt/event request can also be generated by software by writing a '1' in the software interrupt/event register.

**Note:** *The interrupts or events associated to the direct lines are triggered only when the system is in Stop mode. If the system is still running, no interrupt/event is generated by the EXTI.*

### 14.3.1 EXTI block diagram

The extended interrupt/event block diagram is shown on [Figure 33](#).

**Figure 33. Configurable interrupt/event block diagram**

### 14.3.2 Wakeup event management

The STM32L47x/L48x/L49x/L4Ax is able to handle external or internal events in order to wake up the core (WFE). The wakeup event can be generated either by:

- enabling an interrupt in the peripheral control register but not in the NVIC, and enabling the SEVONPEND bit in the Cortex™-M4 System Control register. When the MCU resumes from WFE, the EXTI peripheral interrupt pending bit and the peripheral NVIC IRQ channel pending bit (in the NVIC interrupt clear pending register) have to be cleared
- or by configuring an EXTI line in event mode. When the CPU resumes from WFE, it is not necessary to clear the peripheral interrupt pending bit or the NVIC IRQ channel pending bit as the pending bit corresponding to the event line is not set.

### 14.3.3 Peripherals asynchronous Interrupts

Some peripherals are able to generate events when the system is in run mode and also when the system is in Stop mode, allowing to wake up the system from Stop mode.

To accomplish this, the peripheral generates both a synchronized (to the system clock, e.g. APB clock) and an asynchronous version of the event. This asynchronous event is connected to an EXTI direct line.

*Note: Few peripherals with wakeup from Stop capability are connected to an EXTI configurable line. In this case, the EXTI configuration is necessary to allow the wakeup from Stop mode.*

### 14.3.4 Hardware interrupt selection

To configure a line as an interrupt source, use the following procedure:

1. Configure the corresponding mask bit in the EXTI\_IMR register.
2. Configure the Trigger Selection bits of the Interrupt line (EXTI\_RTISR and EXTI\_FTISR).
3. Configure the enable and mask bits that control the NVIC IRQ channel mapped to the EXTI so that an interrupt coming from one of the EXTI lines can be correctly acknowledged.

*Note: The direct lines do not require any EXTI configuration.*

### 14.3.5 Hardware event selection

To configure a line as an event source, use the following procedure:

1. Configure the corresponding mask bit in the EXTI\_EMR register.
2. Configure the Trigger Selection bits of the Event line (EXTI\_RTISR and EXTI\_FTISR).

### 14.3.6 Software interrupt/event selection

Any of the configurable lines can be configured as a software interrupt/event line. The procedure to generate a software interrupt is as follows:

1. Configure the corresponding mask bit (EXTI\_IMR, EXTI\_EMR).
2. Set the required bit of the software interrupt register (EXTI\_SWIER).

## 14.4 EXTI interrupt/event line mapping

In the STM32L47x/L48x/L49x/L4Ax, 40 (STM32L47x/L48x devices), up to 41 (STM32L49x/L4Ax devices) interrupt/event lines are available. The GPIOs are connected to 16 configurable interrupt/event lines (see [Figure 34](#)).

Figure 34. External interrupt/event GPIO mapping

1. Only on STM32L49x/L4Ax devices

The EXTI lines are connected as shown in [Table 59: EXTI lines connections](#).

Table 59. EXTI lines connections

| EXTI line | Line source <sup>(1)</sup>                             | Line type    |
|-----------|--------------------------------------------------------|--------------|
| 0-15      | GPIO                                                   | configurable |
| 16        | PVD                                                    | configurable |
| 17        | OTG FS wakeup event <sup>(2)(3)</sup><br>(OTG_FS_WKUP) | direct       |
| 18        | RTC alarms                                             | configurable |

Table 59. EXTI lines connections (continued)

| EXTI line         | Line source <sup>(1)</sup>         | Line type    |
|-------------------|------------------------------------|--------------|
| 19                | RTC tamper or timestamp or CSS_LSE | configurable |
| 20                | RTC wakeup timer                   | configurable |
| 21                | COMP1 output                       | configurable |
| 22                | COMP2 output                       | configurable |
| 23                | I2C1 wakeup <sup>(2)</sup>         | direct       |
| 24                | I2C2 wakeup <sup>(2)</sup>         | direct       |
| 25                | I2C3 wakeup                        | direct       |
| 26                | USART1 wakeup <sup>(2)</sup>       | direct       |
| 27                | USART2 wakeup <sup>(2)</sup>       | direct       |
| 28                | USART3 wakeup <sup>(2)</sup>       | direct       |
| 29                | UART4 wakeup <sup>(2)</sup>        | direct       |
| 30                | UART5 wakeup <sup>(2)</sup>        | direct       |
| 31                | LPUART1 wakeup                     | direct       |
| 32                | LPTIM1                             | direct       |
| 33                | LPTIM2 <sup>(2)</sup>              | direct       |
| 34                | SWPMI1 wakeup <sup>(2)</sup>       | direct       |
| 35                | PVM1 wakeup                        | configurable |
| 36                | PVM2 wakeup                        | configurable |
| 37                | PVM3 wakeup                        | configurable |
| 38                | PVM4 wakeup                        | configurable |
| 39                | LCD wakeup <sup>(4)</sup>          | direct       |
| 40 <sup>(5)</sup> | I2C4 wakeup                        | direct       |

1. All the lines can wake up from the Stop 0 and Stop 1 modes. All the lines, except the ones mentioned above, can wake up from the Stop 2 mode.
2. This line source cannot wake up from the Stop 2 mode.
3. Available only on STM32L4x5/L4x6 devices.
4. Available only on STM32L4x6 devices.
5. Only for STM32L49x/L4Ax devices

## 14.5 EXTI registers

Refer to [Section 1.2 on page 69](#) for a list of abbreviations used in register descriptions.

The peripheral registers have to be accessed by words (32-bit).

### 14.5.1 Interrupt mask register 1 (EXTI\_IMR1)

Address offset: 0x00

Reset value: 0xFF82 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| IM31 | IM30 | IM29 | IM28 | IM27 | IM26 | IM25 | IM24 | IM23 | IM22 | IM21 | IM20 | IM19 | IM18 | IM17 | IM16 |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| IM15 | IM14 | IM13 | IM12 | IM11 | IM10 | IM9  | IM8  | IM7  | IM6  | IM5  | IM4  | IM3  | IM2  | IM1  | IM0  |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:0 **IMx**: Interrupt Mask on line x (x = 31 to 0)

0: Interrupt request from Line x is masked

1: Interrupt request from Line x is not masked

**Note:** The reset value for the direct lines (line 17, lines from 23 to 34, line 39) is set to '1' in order to enable the interrupt by default.

### 14.5.2 Event mask register 1 (EXTI\_EMR1)

Address offset: 0x04

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| EM15 | EM14 | EM13 | EM12 | EM11 | EM10 | EM9  | EM8  | EM7  | EM6  | EM5  | EM4  | EM3  | EM2  | EM1  | EM0  |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:0 **EMx**: Event mask on line x (x = 31 to 0)

0: Event request from line x is masked

1: Event request from line x is not masked

### 14.5.3 Rising trigger selection register 1 (EXTI\_RTSR1)

Address offset: 0x08

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RT22 | RT21 | RT20 | RT19 | RT18 | Res. | RT16 |
|      |      |      |      |      |      |      |      |      | rW   | rW   | rW   | rW   | rW   |      | rW   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| RT15 | RT14 | RT13 | RT12 | RT11 | RT10 | RT9  | RT8  | RT7  | RT6  | RT5  | RT4  | RT3  | RT2  | RT1  | RT0  |
| rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:18 **RTx**: Rising trigger event configuration bit of line x (x = 22 to 18)

0: Rising trigger disabled (for Event and Interrupt) for input line

1: Rising trigger enabled (for Event and Interrupt) for input line

Bit 17 Reserved, must be kept at reset value.

Bits 16:0 **RTx**: Rising trigger event configuration bit of line x (x = 16 to 0)

0: Rising trigger disabled (for Event and Interrupt) for input line

1: Rising trigger enabled (for Event and Interrupt) for input line

**Note:** *The configurable wakeup lines are edge-triggered. No glitch must be generated on these lines. If a rising edge on a configurable interrupt line occurs during a write operation in the EXTI\_RTSR register, the pending bit is not set.*

*Rising and falling edge triggers can be set for the same interrupt line. In this case, both generate a trigger condition.*

#### 14.5.4 Falling trigger selection register 1 (EXTI\_FTSR1)

Address offset: 0x0C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:18 **FTx**: Falling trigger event configuration bit of line x (x = 22 to 18)

0: Falling trigger disabled (for Event and Interrupt) for input line

1: Falling trigger enabled (for Event and Interrupt) for input line

Bit 17 Reserved, must be kept at reset value.

Bits 16:0 **FTx**: Falling trigger event configuration bit of line x (x = 16 to 0)

0: Falling trigger disabled (for Event and Interrupt) for input line

1: Falling trigger enabled (for Event and Interrupt) for input line

**Note:** The configurable wakeup lines are edge-triggered. No glitch must be generated on these lines. If a falling edge on a configurable interrupt line occurs during a write operation to the EXTI\_FTSR register, the pending bit is not set.

Rising and falling edge triggers can be set for the same interrupt line. In this case, both generate a trigger condition.

### 14.5.5 Software interrupt event register 1 (EXTI\_SWIER1)

Address offset: 0x10

Reset value: 0x0000 0000

| 31     | 30     | 29     | 28     | 27     | 26     | 25    | 24    | 23    | 22     | 21     | 20     | 19     | 18     | 17    | 16     |

| rw     | rw     | rw     | rw     | rw     | rw     | rw    | rw    | rw    | rw     | rw     | rw     | rw     | rw     | rw    | rw     |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22: 18 **SWIx**: Software interrupt on line x (x = 22 o 18)

If the interrupt is enabled on this line in the EXTI\_IMR, writing a '1' to this bit when it is at '0' sets the corresponding pending bit in EXTI\_PR resulting in an interrupt request generation.

This bit is cleared by clearing the corresponding bit in the EXTI\_PR register (by writing a '1' into the bit).

Bit 17 Reserved, must be kept at reset value.

Bits 16:0 **SWIx**: Software interrupt on line x (x = 16 to 0)

If the interrupt is enabled on this line in the EXTI\_IMR, writing a '1' to this bit when it is at '0' sets the corresponding pending bit in EXTI\_PR resulting in an interrupt request generation.

This bit is cleared by clearing the corresponding bit of EXTI\_PR (by writing a '1' into the bit).

### 14.5.6 Pending register 1 (EXTI\_PR1)

Address offset: 0x14

Reset value: 0x0000 0000

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:18 **PIFx**: Pending interrupt flag on line x (x = 22 to 18)

0: No trigger request occurred

1: Selected trigger request occurred

This bit is set when the selected edge event arrives on the interrupt line. This bit is cleared by writing a '1' to the bit.

Bit 17 Reserved, must be kept at reset value.

Bits 16:0 **PIFx**: Pending interrupt flag on line x (x = 16 to 0)

0: No trigger request occurred

1: Selected trigger request occurred

This bit is set when the selected edge event arrives on the interrupt line. This bit is cleared by writing a '1' to the bit.

### 14.5.7 Interrupt mask register 2 (EXTI\_IMR2)

Address offset: 0x20

Reset value:

0x0000 0087 for STM32L47x/L48x devices

0x0000 0187 for STM32L49x/L4Ax devices

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:8 Reserved, must be kept at reset value

Bits 8:0 **IMx**: Interrupt mask on line x (x = 40 to 32)

0: Interrupt request from line x is masked

1: Interrupt request from line x is not masked

**Note:** The reset value for the direct lines (line 17, lines from 23 to 34, line 40) is set to '1' in order to enable the interrupt by default.

**Note:** IM40 only applicable for STM32L49x/L4Ax devices

### 14.5.8 Event mask register 2 (EXTI\_EMR2)

Address offset: 0x24

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

|      |      |      |      |      |      |      | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:8 Reserved, must be kept at reset value

Bits 8:0 **EMx**: Event mask on line x (x = 40 to 32)

0: Event request from line x is masked

1: Event request from line x is not masked

*Note:* EM40 only applicable for STM32L49x/L4Ax devices

### 14.5.9 Rising trigger selection register 2 (EXTI\_RTSTR2)

Address offset: 0x28

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RT38 | RT37 | RT36 | RT35 | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      | rw   | rw   | rw   | rw   |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **RTx**: Rising trigger event configuration bit of line x (x = 35 to 38)

0: Rising trigger disabled (for Event and Interrupt) for input line

1: Rising trigger enabled (for Event and Interrupt) for input line

Bits 2:0 Reserved, must be kept at reset value.

*Note:* The configurable wakeup lines are edge-triggered. No glitch must be generated on these lines. If a rising edge on a configurable interrupt line occurs during a write operation to the EXTI\_RTSTR register, the pending bit is not set.

Rising and falling edge triggers can be set for the same interrupt line. In this case, both generate a trigger condition.

### 14.5.10 Falling trigger selection register 2 (EXTI\_FTSR2)

Address offset: 0x2C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FT38 | FT37 | FT36 | FT35 | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      | rw   | rw   | rw   | rw   |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **FTx**: Falling trigger event configuration bit of line x (x = 35 to 38)

0: Falling trigger disabled (for Event and Interrupt) for input line

1: Falling trigger enabled (for Event and Interrupt) for input line

Bits 2:0 Reserved, must be kept at reset value.

**Note:** *The configurable wakeup lines are edge-triggered. No glitch must be generated on these lines. If a falling edge on a configurable interrupt line occurs during a write operation to the EXTI\_FTSR register, the pending bit is not set.*

*Rising and falling edge triggers can be set for the same interrupt line. In this case, both generate a trigger condition.*

### 14.5.11 Software interrupt event register 2 (EXTI\_SWIER2)

Address offset: 0x30

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |        |        |        |        |      |      |      |
|------|------|------|------|------|------|------|------|------|--------|--------|--------|--------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22     | 21     | 20     | 19     | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.   | Res.   | Res.   | Res.   | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |        |        |        |        |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6      | 5      | 4      | 3      | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SWI 38 | SWI 37 | SWI 36 | SWI 35 | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      | rw     | rw     | rw     | rw     |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **SWIx**: Software interrupt on line x (x = 35 to 38)

If the interrupt is enabled on this line in EXTI\_IMR, writing a '1' to this bit when it is at '0' sets the corresponding pending bit of EXTI\_PR resulting in an interrupt request generation.

This bit is cleared by clearing the corresponding bit of EXTI\_PR (by writing a '1' to the bit).

Bits 2:0 Reserved, must be kept at reset value.

### 14.5.12 Pending register 2 (EXTI\_PR2)

Address offset: 0x34

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |       |       |       |       |      |      |      |
|------|------|------|------|------|------|------|------|------|-------|-------|-------|-------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22    | 21    | 20    | 19    | 18   | 17   | 16   |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PIF38 | PIF37 | PIF36 | PIF35 | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      | rc_w1 | rc_w1 | rc_w1 | rc_w1 |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **PIFx**: Pending interrupt flag on line x (x = 35 to 38)

0: No trigger request occurred

1: Selected trigger request occurred

This bit is set when the selected edge event arrives on the interrupt line. This bit is cleared by writing a '1' into the bit.

Bits 2:0 Reserved, must be kept at reset value.

### 14.5.13 EXTI register map

Table 60 gives the EXTI register map and the reset values.

Table 60. Extended interrupt/event controller register map and reset values

| Offset | Register    | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22    | 21    | 20    | 19    | 18    | 17   | 16    | 15    | 14    | 13    | 12    | 11    | 10    | 9    | 8    | 7    | 6     | 5     | 4     | 3     | 2    | 1    | 0    |

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 15 Cyclic redundancy check calculation unit (CRC)

### 15.1 Introduction

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from 8-, 16- or 32-bit data word and a generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the functional safety standards, they offer a means of verifying the flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link time and stored at a given memory location.

### 15.2 CRC main features

- Uses CRC-32 (Ethernet) polynomial: 0x4C11DB7  
$$X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$$
- Alternatively, uses fully programmable polynomial with programmable size (7, 8, 16, 32 bits)
- Handles 8-, 16-, 32-bit data size
- Programmable CRC initial value
- Single input/output 32-bit data register
- Input buffer to avoid bus stall during calculation
- CRC computation done in 4 AHB clock cycles (HCLK) for the 32-bit data size
- General-purpose 8-bit register (can be used for temporary storage)
- Reversibility option on I/O data
- Accessed through AHB slave peripheral by 32-bit words only, with the exception of CRC\_DR register that can be accessed by words, right-aligned half-words and right-aligned bytes

## 15.3 CRC functional description

### 15.3.1 CRC block diagram

Figure 35. CRC calculation unit block diagram

### 15.3.2 CRC internal signals

Table 61. CRC internal input/output signals

| Signal name | Signal type   | Description |
|-------------|---------------|-------------|
| crc_hclk    | Digital input | AHB clock   |

### 15.3.3 CRC operation

The CRC calculation unit has a single 32-bit read/write data register (CRC\_DR). It is used to input new data (write access), and holds the result of the previous CRC calculation (read access).

Each write operation to the data register creates a combination of the previous CRC value (stored in CRC\_DR) and the new one. CRC computation is done on the whole 32-bit data word or byte by byte depending on the format of the data being written.

The CRC\_DR register can be accessed by word, right-aligned half-word and right-aligned byte. For the other registers only 32-bit accesses are allowed.

The duration of the computation depends on data width:

- 4 AHB clock cycles for 32 bits
- 2 AHB clock cycles for 16 bits
- 1 AHB clock cycles for 8 bits

An input buffer allows a second data to be immediately written without waiting for any wait-states due to the previous CRC calculation.

The data size can be dynamically adjusted to minimize the number of write accesses for a given number of bytes. For instance, a CRC for 5 bytes can be computed with a word write followed by a byte write.

The input data can be reversed to manage the various endianness schemes. The reversing operation can be performed on 8 bits, 16 bits and 32 bits depending on the REV\_IN[1:0] bits in the CRC\_CR register.

For example, 0x1A2B3C4D input data are used for CRC calculation as:

- 0x58D43CB2 with bit-reversal done by byte
- 0xD458B23C with bit-reversal done by half-word
- 0xB23CD458 with bit-reversal done on the full word

The output data can also be reversed by setting the REV\_OUT bit in the CRC\_CR register.

The operation is done at bit level. For example, 0x11223344 output data are converted to 0x22CC4488.

The CRC calculator can be initialized to a programmable value using the RESET control bit in the CRC\_CR register (the default value is 0xFFFFFFFF).

The initial CRC value can be programmed with the CRC\_INIT register. The CRC\_DR register is automatically initialized upon CRC\_INIT register write access.

The CRC\_IDR register can be used to hold a temporary value related to CRC calculation. It is not affected by the RESET bit in the CRC\_CR register.

### Polynomial programmability

The polynomial coefficients are fully programmable through the CRC\_POL register, and the polynomial size can be configured to be 7, 8, 16 or 32 bits by programming the POLYSIZE[1:0] bits in the CRC\_CR register. Even polynomials are not supported.

*Note: The type of an even polynomial is  $X+X^2+..+X^n$ , while the type of an odd polynomial is  $1+X+X^2+..+X^n$ .*

If the CRC data is less than 32-bit, its value can be read from the least significant bits of the CRC\_DR register.

To obtain a reliable CRC calculation, the change on-fly of the polynomial value or size can not be performed during a CRC calculation. As a result, if a CRC calculation is ongoing, the application must either reset it or perform a CRC\_DR read before changing the polynomial.

The default polynomial value is the CRC-32 (Ethernet) polynomial: 0x4C11DB7.

## 15.4 CRC registers

The CRC\_DR register can be accessed by words, right-aligned half-words and right-aligned bytes. For the other registers only 32-bit accesses are allowed.

### 15.4.1 CRC data register (CRC\_DR)

Address offset: 0x00

Reset value: 0xFFFF FFFF

Bits 31:0 **DR[31:0]**: Data register bits

This register is used to write new data to the CRC calculator.

It holds the previous CRC calculation result when it is read.

If the data size is less than 32 bits, the least significant bits are used to write/read the correct value.

### 15.4.2 CRC independent data register (CRC\_IDR)

Address offset: 0x04

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |          |      |      |      |      |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **IDR[7:0]**: General-purpose 8-bit data register bits

These bits can be used as a temporary storage location for one byte.

This register is not affected by CRC resets generated by the RESET bit in the CRC\_CR register

### 15.4.3 CRC control register (CRC\_CR)

Address offset: 0x08

Reset value: 0x0000 0000

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **REV\_OUT**: Reverse output data

This bit controls the reversal of the bit order of the output data.

0: Bit order not affected

1: Bit-reversed output format

Bits 6:5 **REV\_IN[1:0]**: Reverse input data

This bitfield controls the reversal of the bit order of the input data

00: Bit order not affected

01: Bit reversal done by byte

10: Bit reversal done by half-word

11: Bit reversal done by word

Bits 4:3 **POLYSIZE[1:0]**: Polynomial size

These bits control the size of the polynomial.

00: 32 bit polynomial

01: 16 bit polynomial

10: 8 bit polynomial

11: 7 bit polynomial

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RESET**: RESET bit

This bit is set by software to reset the CRC calculation unit and set the data register to the value stored in the CRC\_INIT register. This bit can only be set, it is automatically cleared by hardware

### 15.4.4 CRC initial value (CRC\_INIT)

Address offset: 0x10

Reset value: 0xFFFF FFFF

|                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31              | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CRC_INIT[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw              | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15              | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CRC_INIT[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw              | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **CRC\_INIT[31:0]**: Programmable initial CRC value  
This register is used to write the CRC initial value.

### 15.4.5 CRC polynomial (CRC\_POL)

Address offset: 0x14

Reset value: 0x04C1 1DB7

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| POL[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| POL[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **POL[31:0]**: Programmable polynomial  
This register is used to write the coefficients of the polynomial to be used for CRC calculation.  
If the polynomial size is less than 32 bits, the least significant bits have to be used to program the correct value.

## 15.4.6 CRC register map

Table 62. CRC register map and reset values

| Offset | Register name | 31             | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7        | 6       | 5           | 4 | 3             | 2 | 1   | 0   |       |

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 16 Flexible static memory controller (FSMC)

### 16.1 Introduction

The flexible static memory controller (FSMC) includes two memory controllers:

- The NOR/PSRAM memory controller
- The NAND memory controller

This memory controller is also named flexible memory controller (FMC).

### 16.2 FMC main features

The FMC functional block makes the interface with: synchronous and asynchronous static memories, and NAND flash memory. Its main purposes are:

- to translate AHB transactions into the appropriate external device protocol
- to meet the access time requirements of the external memory devices

All external memories share the addresses, data and control signals with the controller. Each external device is accessed by means of a unique chip select. The FMC performs only one access at a time to an external device.

The main features of the FMC controller are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR flash memory/OneNAND flash memory
  - PSRAM (4 memory banks)
  - NAND flash memory with ECC hardware to check up to 8 Kbytes of data
- Interface with parallel LCD modules, supporting Intel 8080 and Motorola 6800 modes.
- Burst mode support for faster access to synchronous devices such as NOR flash memory, PSRAM)
- Programmable continuous clock output for asynchronous and synchronous accesses
- 8-,16-bit wide data bus
- Independent chip select control for each memory bank
- Independent configuration for each memory bank
- Write enable and byte lane select outputs for use with PSRAM, SRAM devices
- External asynchronous wait control
- Write FIFO with 16 x32-bit depth

The Write FIFO is common to all memory controllers and consists of:

- a Write Data FIFO which stores the AHB data to be written to the memory (up to 32 bits) plus one bit for the AHB transfer (burst or not sequential mode)
- a Write Address FIFO which stores the AHB address (up to 28 bits) plus the AHB data size (up to 2 bits). When operating in burst mode, only the start address is stored except when crossing a page boundary (for PSRAM). In this case, the AHB burst is broken into two FIFO entries.

The Write FIFO can be disabled by setting the WFDIS bit in the FMC\_BCR1 register (only for STM32L49x/L4Ax devices).

At startup the FSMC pins must be configured by the user application. The FSMC I/O pins which are not used by the application can be used for other purposes.

The FSMC registers that define the external device type and associated characteristics are usually set at boot time and do not change until the next reset or power-up. However, the settings can be changed at any time.

## 16.3 FSMC block diagram

The FSMC consists of the following main blocks:

- The AHB interface (including the FSMC configuration registers)
- The NOR flash/PSRAM/SRAM controller
- The external device interface
- The NAND flash controller

The block diagram is shown in the figure below.

**Figure 36. FSMC block diagram**

## 16.4 AHB interface

The AHB slave interface allows internal CPUs and other bus master peripherals to access the external memories.

AHB transactions are translated into the external device protocol. In particular, if the selected external memory is 16- or 8-bit wide, 32-bit wide transactions on the AHB are split into consecutive 16- or 8-bit accesses. The FSMC chip select (FMC\_NEx) does not toggle between the consecutive accesses except in case of Access mode D when the Extended mode is enabled.

The FMC generates an AHB error in the following conditions:

- When reading or writing to a FMC bank (Bank 1 to 4) which is not enabled.
- When reading or writing to the NOR flash bank while the FACCEN bit is reset in the FMC\_BCRx register.

The effect of an AHB error depends on the AHB master which has attempted the R/W access:

- If the access has been attempted by the Cortex®-M4 CPU, a hard fault interrupt is generated.
- If the access has been performed by a DMA controller, a DMA transfer error is generated and the corresponding DMA channel is automatically disabled.

The AHB clock (HCLK) is the reference clock for the FMC.

## 16.4.1 Supported memories and transactions

### General transaction rules

The requested AHB transaction data size can be 8-, 16- or 32-bit wide whereas the accessed external device has a fixed data width. This may lead to inconsistent transfers.

Therefore, some simple transaction rules must be followed:

- AHB transaction size and memory data size are equal  
There is no issue in this case.
- AHB transaction size is greater than the memory size:  
In this case, the FMC splits the AHB transaction into smaller consecutive memory accesses to meet the external data width. The FMC chip select (FMC\_NEx) does not toggle between the consecutive accesses.
- AHB transaction size is smaller than the memory size:  
The transfer may or not be consistent depending on the type of external device:
  - Accesses to devices that have the byte select feature (SRAM, ROM, PSRAM)  
In this case, the FMC allows read/write transactions and accesses to the right data through its byte lanes NBL[1:0].  
Bytes to be written are addressed by NBL[1:0].  
All memory bytes are read (NBL[1:0] are driven low during read transaction) and the useless ones are discarded.
  - Accesses to devices that do not have the byte select feature (NOR and NAND flash memories)  
This situation occurs when a byte access is requested to a 16-bit wide flash memory. Since the device cannot be accessed in Byte mode (only 16-bit words can be read/written from/to the flash memory), Write transactions and Read transactions are allowed (the controller reads the entire 16-bit memory word and uses only the required byte).

### Wrap support for NOR flash/PSRAM

Wrap burst mode for synchronous memories is not supported. The memories must be configured in Linear burst mode of undefined length.

Configuration registers

The FMC can be configured through a set of registers. Refer to [Section 16.6.6](#), for a detailed description of the NOR flash/PSRAM controller registers. Refer to [Section 16.7.7](#), for a detailed description of the NAND flash registers.

16.5 External device address mapping

From the FMC point of view, the external memory is divided into fixed-size banks of 256 Mbytes each (see [Figure 37](#)):

- Bank 1 used to address up to 4 NOR flash memory or PSRAM devices. This bank is split into 4 NOR/PSRAM subbanks with 4 dedicated chip selects, as follows:
  - Bank 1 - NOR/PSRAM 1
  - Bank 1 - NOR/PSRAM 2
  - Bank 1 - NOR/PSRAM 3
  - Bank 1 - NOR/PSRAM 4
- Bank 3 used to address NAND flash memory devices. The MPU memory attribute for this space must be reconfigured by software to Device.

For each bank the type of memory to be used can be configured by the user application through the Configuration register.

Figure 37. FMC memory banks

16.5.1 NOR/PSRAM address mapping

HADDR[27:26] bits are used to select one of the four memory banks as shown in [Table 63](#).

Table 63. NOR/PSRAM bank selection

| HADDR[27:26] <sup>(1)</sup> | Selected bank        |
|-----------------------------|----------------------|
| 00                          | Bank 1 - NOR/PSRAM 1 |
| 01                          | Bank 1 - NOR/PSRAM 2 |
| 10                          | Bank 1 - NOR/PSRAM 3 |
| 11                          | Bank 1 - NOR/PSRAM 4 |

1. HADDR are internal AHB address lines that are translated to external memory.

The HADDR[25:0] bits contain the external memory address. Since HADDR is a byte address whereas the memory is addressed at word level, the address actually issued to the memory varies according to the memory data width, as shown in the following table.

Table 64. NOR/PSRAM External memory address

| Memory width <sup>(1)</sup> | Data address issued to the memory | Maximum memory capacity (bits) |
|-----------------------------|-----------------------------------|--------------------------------|
| 8-bit                       | HADDR[25:0]                       | 64 Mbytes x 8 = 512 Mbits      |
| 16-bit                      | HADDR[25:1] >> 1                  | 64 Mbytes/2 x 16 = 512 Mbits   |

1. In case of a 16-bit external memory width, the FSMC internally uses HADDR[25:1] to generate the address for external memory FMC\_A[24:0].  
Whatever the external memory width, FMC\_A[0] must be connected to external memory address A[0].

## 16.5.2 NAND flash memory address mapping

The NAND bank is divided into memory areas as indicated in [Table 65](#).

Table 65. NAND memory mapping and timing registers

| Start address | End address | FMC bank            | Memory space | Timing register |
|---------------|-------------|---------------------|--------------|-----------------|
| 0x8800 0000   | 0x8BFF FFFF | Bank 3 - NAND flash | Attribute    | FMC_PATT (0x8C) |
| 0x8000 0000   | 0x83FF FFFF |                     | Common       | FMC_PMEM (0x88) |

For NAND flash memory, the common and attribute memory spaces are subdivided into three sections (see in [Table 66](#) below) located in the lower 256 Kbytes:

- Data section (first 64 Kbytes in the common/attribute memory space)
- Command section (second 64 Kbytes in the common / attribute memory space)
- Address section (next 128 Kbytes in the common / attribute memory space)

Table 66. NAND bank selection

| Section name    | HADDR[17:16] | Address range     |
|-----------------|--------------|-------------------|
| Address section | 1X           | 0x020000-0x03FFFF |
| Command section | 01           | 0x010000-0x01FFFF |
| Data section    | 00           | 0x000000-0x0FFFFF |

The application software uses the 3 sections to access the NAND flash memory:

- **To sending a command to NAND flash memory**, the software must write the command value to any memory location in the command section.
- **To specify the NAND flash address that must be read or written**, the software must write the address value to any memory location in the address section. Since an address can be 4 or 5 bytes long (depending on the actual memory size), several consecutive write operations to the address section are required to specify the full address.
- **To read or write data**, the software reads or writes the data from/to any memory location in the data section.

Since the NAND flash memory automatically increments addresses, there is no need to increment the address of the data section to access consecutive memory locations.

## 16.6 NOR flash/PSRAM controller

The FMC generates the appropriate signal timings to drive the following types of memories:

- Asynchronous SRAM and ROM
  - 8 bits
  - 16 bits
- PSRAM (CellularRAM™)
  - Asynchronous mode
  - Burst mode for synchronous accesses
  - Multiplexed or non-multiplexed
- NOR flash memory
  - Asynchronous mode
  - Burst mode for synchronous accesses
  - Multiplexed or non-multiplexed

The FMC outputs a unique chip select signal, NE[4:1], per bank. All the other signals (addresses, data and control) are shared.

The FMC supports a wide range of devices through a programmable timings among which:

- Programmable wait states (up to 15)
- Programmable bus turnaround cycles (up to 15)
- Programmable output enable and write enable delays (up to 15)
- Independent read and write timings and protocol to support the widest variety of memories and timings
- Programmable continuous clock (FMC\_CLK) output.

The FMC Clock (FMC\_CLK) is a submultiple of the HCLK clock. It can be delivered to the selected external device either during synchronous accesses only or during asynchronous and synchronous accesses depending on the CCKEN bit configuration in the FMC\_BCR1 register:

- If the CCKEN bit is reset, the FMC generates the clock (CLK) only during synchronous accesses (Read/write transactions).
- If the CCKEN bit is set, the FMC generates a continuous clock during asynchronous and synchronous accesses. To generate the FMC\_CLK continuous clock, Bank 1 must

be configured in Synchronous mode (see [Section 16.6.6: NOR/PSRAM controller registers](#)). Since the same clock is used for all synchronous memories, when a continuous output clock is generated and synchronous accesses are performed, the AHB data size has to be the same as the memory data width (MWID) otherwise the FMC\_CLK frequency is changed depending on AHB data transaction (refer to [Section 16.6.5: Synchronous transactions](#) for FMC\_CLK divider ratio formula).

The size of each bank is fixed and equal to 64 Mbytes. Each bank is configured through dedicated registers (see [Section 16.6.6: NOR/PSRAM controller registers](#)).

The programmable memory parameters include access times (see [Table 67](#)) and support for wait management (for PSRAM and NOR flash accessed in Burst mode).

**Table 67. Programmable NOR/PSRAM access parameters**

| Parameter          | Function                                                                         | Access mode                               | Unit                     | Min. | Max. |
|--------------------|----------------------------------------------------------------------------------|-------------------------------------------|--------------------------|------|------|
| Address setup      | Duration of the address setup phase                                              | Asynchronous                              | AHB clock cycle (HCLK)   | 0    | 15   |
| Address hold       | Duration of the address hold phase                                               | Asynchronous, muxed I/Os                  | AHB clock cycle (HCLK)   | 1    | 15   |
| Data setup         | Duration of the data setup phase                                                 | Asynchronous                              | AHB clock cycle (HCLK)   | 1    | 256  |
| Burst turn         | Duration of the bus turnaround phase                                             | Asynchronous and synchronous read / write | AHB clock cycle (HCLK)   | 0    | 15   |
| Clock divide ratio | Number of AHB clock cycles (HCLK) to build one memory clock cycle (CLK)          | Synchronous                               | AHB clock cycle (HCLK)   | 2    | 16   |
| Data latency       | Number of clock cycles to issue to the memory before the first data of the burst | Synchronous                               | Memory clock cycle (CLK) | 2    | 17   |

### 16.6.1 External memory interface signals

[Table 68](#), [Table 69](#) and [Table 70](#) list the signals that are typically used to interface with NOR flash memory, SRAM and PSRAM.

*Note:* The prefix “N” identifies the signals that are active low.

#### NOR flash memory, non-multiplexed I/Os

**Table 68. Non-multiplexed I/O NOR flash memory**

| FMC signal name | I/O | Function                       |
|-----------------|-----|--------------------------------|
| CLK             | O   | Clock (for synchronous access) |
| A[25:0]         | O   | Address bus                    |
| D[15:0]         | I/O | Bidirectional data bus         |
| NE[x]           | O   | Chip select, x = 1..4          |
| NOE             | O   | Output enable                  |
| NWE             | O   | Write enable                   |

**Table 68. Non-multiplexed I/O NOR flash memory (continued)**

| FMC signal name | I/O | Function                                                                            |
|-----------------|-----|-------------------------------------------------------------------------------------|
| NL(=NADV)       | O   | Latch enable (this signal is called address valid, NADV, by some NOR flash devices) |
| NWAIT           | I   | NOR flash wait input signal to the FSMC                                             |

The maximum capacity is 512 Mbits (26 address lines).

### NOR flash memory, 16-bit multiplexed I/Os

**Table 69. 16-bit multiplexed I/O NOR flash memory**

| FMC signal name | I/O | Function                                                                                                                        |
|-----------------|-----|---------------------------------------------------------------------------------------------------------------------------------|
| CLK             | O   | Clock (for synchronous access)                                                                                                  |
| A[25:16]        | O   | Address bus                                                                                                                     |
| AD[15:0]        | I/O | 16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus) |
| NE[x]           | O   | Chip select, x = 1..4                                                                                                           |
| NOE             | O   | Output enable                                                                                                                   |
| NWE             | O   | Write enable                                                                                                                    |
| NL(=NADV)       | O   | Latch enable (this signal is called address valid, NADV, by some NOR flash devices)                                             |
| NWAIT           | I   | NOR flash wait input signal to the FSMC                                                                                         |

The maximum capacity is 512 Mbits.

### PSRAM/SRAM, non-multiplexed I/Os

**Table 70. Non-multiplexed I/Os PSRAM/SRAM**

| FMC signal name | I/O | Function                                                                  |
|-----------------|-----|---------------------------------------------------------------------------|
| CLK             | O   | Clock (only for PSRAM synchronous access)                                 |
| A[25:0]         | O   | Address bus                                                               |
| D[15:0]         | I/O | Data bidirectional bus                                                    |
| NE[x]           | O   | Chip select, x = 1..4 (called NCE by PSRAM (CellularRAM™ i.e. CRAM))      |
| NOE             | O   | Output enable                                                             |
| NWE             | O   | Write enable                                                              |
| NL(= NADV)      | O   | Address valid only for PSRAM input (memory signal name: NADV)             |
| NWAIT           | I   | PSRAM wait input signal to the FSMC                                       |
| NBL[1:0]        | O   | Byte lane output. Byte 0 and Byte 1 control (upper and lower byte enable) |

The maximum capacity is 512 Mbits.

**PSRAM, 16-bit multiplexed I/Os****Table 71. 16-Bit multiplexed I/O PSRAM**

| FMC signal name | I/O | Function                                                                                                                        |
|-----------------|-----|---------------------------------------------------------------------------------------------------------------------------------|
| CLK             | O   | Clock (for synchronous access)                                                                                                  |
| A[25:16]        | O   | Address bus                                                                                                                     |
| AD[15:0]        | I/O | 16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus) |
| NE[x]           | O   | Chip select, x = 1..4 (called NCE by PSRAM (CellularRAM™ i.e. CRAM))                                                            |
| NOE             | O   | Output enable                                                                                                                   |
| NWE             | O   | Write enable                                                                                                                    |
| NL(= NADV)      | O   | Address valid PSRAM input (memory signal name: NADV)                                                                            |
| NWAIT           | I   | PSRAM wait input signal to the FMC                                                                                              |
| NBL[1:0]        | O   | Byte lane output. Byte 0 and Byte 1 control (upper and lower byte enable)                                                       |

The maximum capacity is 512 Mbits (26 address lines).

**16.6.2 Supported memories and transactions**

[Table 72](#) below shows an example of the supported devices, access modes and transactions when the memory data bus is 16-bit wide for NOR flash memory, PSRAM and SRAM. The transactions not allowed (or not supported) by the FMC are shown in gray in this example.

**Table 72. NOR flash/PSRAM: example of supported memories and transactions**

| Device                                   | Mode              | R/W | AHB data size | Memory data size | Allowed/ not allowed | Comments                  |
|------------------------------------------|-------------------|-----|---------------|------------------|----------------------|---------------------------|
| NOR flash (muxed I/Os and nonmuxed I/Os) | Asynchronous      | R   | 8             | 16               | Y                    | -                         |
|                                          | Asynchronous      | W   | 8             | 16               | N                    | -                         |
|                                          | Asynchronous      | R   | 16            | 16               | Y                    | -                         |
|                                          | Asynchronous      | W   | 16            | 16               | Y                    | -                         |
|                                          | Asynchronous      | R   | 32            | 16               | Y                    | Split into 2 FMC accesses |
|                                          | Asynchronous      | W   | 32            | 16               | Y                    | Split into 2 FMC accesses |
|                                          | Asynchronous page | R   | -             | 16               | N                    | Mode is not supported     |
|                                          | Synchronous       | R   | 8             | 16               | N                    | -                         |
|                                          | Synchronous       | R   | 16            | 16               | Y                    | -                         |
|                                          | Synchronous       | R   | 32            | 16               | Y                    | -                         |

**Table 72. NOR flash/PSRAM: example of supported memories and transactions (continued)**

| Device                                            | Mode              | R/W | AHB data size | Memory data size | Allowed/ not allowed | Comments                                                |
|---------------------------------------------------|-------------------|-----|---------------|------------------|----------------------|---------------------------------------------------------|
| PSRAM (multiplexed I/Os and non-multiplexed I/Os) | Asynchronous      | R   | 8             | 16               | Y                    | -                                                       |
|                                                   | Asynchronous      | W   | 8             | 16               | Y                    | Use of byte lanes NBL[1:0]                              |
|                                                   | Asynchronous      | R   | 16            | 16               | Y                    | -                                                       |
|                                                   | Asynchronous      | W   | 16            | 16               | Y                    | -                                                       |
|                                                   | Asynchronous      | R   | 32            | 16               | Y                    | Split into 2 FMC accesses                               |
|                                                   | Asynchronous      | W   | 32            | 16               | Y                    | Split into 2 FMC accesses                               |
|                                                   | Asynchronous page | R   | -             | 16               | N                    | Mode is not supported                                   |
|                                                   | Synchronous       | R   | 8             | 16               | N                    | -                                                       |
|                                                   | Synchronous       | R   | 16            | 16               | Y                    | -                                                       |
|                                                   | Synchronous       | R   | 32            | 16               | Y                    | -                                                       |

|                                                   | Synchronous       | W   | 16/32         | 16               | Y                    | -                                                       |
| SRAM and ROM                                      | Asynchronous      | R   | 8 / 16        | 16               | Y                    | -                                                       |
|                                                   | Asynchronous      | W   | 8 / 16        | 16               | Y                    | Use of byte lanes NBL[1:0]                              |
|                                                   | Asynchronous      | R   | 32            | 16               | Y                    | Split into 2 FMC accesses                               |
|                                                   | Asynchronous      | W   | 32            | 16               | Y                    | Split into 2 FMC accesses<br>Use of byte lanes NBL[1:0] |

### 16.6.3 General timing rules

#### Signals synchronization

- All controller output signals change on the rising edge of the internal clock (HCLK)
- In Synchronous mode (read or write), all output signals change on the rising edge of HCLK. Whatever the CLKDIV value, all outputs change as follows:
  - NOEL/NWEL/ NEL/NADVL/ NADVH /NBLL/ Address valid outputs change on the falling edge of FMC\_CLK clock.
  - NOEH/ NWEH / NEH/ NOEH/NBLH/ Address invalid outputs change on the rising edge of FMC\_CLK clock.

### 16.6.4 NOR flash/PSRAM controller asynchronous transactions

#### Asynchronous static memories (NOR flash, PSRAM, SRAM)

- Signals are synchronized by the internal clock HCLK. This clock is not issued to the memory

- The FMC always samples the data before de-asserting the NOE signal. This guarantees that the memory data hold timing constraint is met (minimum Chip Enable high to data transition is usually 0 ns)
- If the Extended mode is enabled (EXTMOD bit is set in the FMC\_BCRx register), up to four extended modes (A, B, C and D) are available. It is possible to mix A, B, C and D modes for read and write operations. For example, read operation can be performed in mode A and write in mode B.
- If the Extended mode is disabled (EXTMOD bit is reset in the FMC\_BCRx register), the FMC can operate in mode 1 or mode 2 as follows:
  - Mode 1 is the default mode when SRAM/PSRAM memory type is selected (MTYP = 0x0 or 0x01 in the FMC\_BCRx register)
  - Mode 2 is the default mode when NOR memory type is selected (MTYP = 0x10 in the FMC\_BCRx register).

### Mode 1 - SRAM/PSRAM (CRAM)

The next figures show the read and write transactions for the supported modes followed by the required configuration of FMC\_BCRx, and FMC\_BTRx/FMC\_BWTRx registers.

**Figure 38. Mode 1 read access waveforms**

Figure 39. Mode 1 write access waveforms

The one HCLK cycle at the end of the write transaction helps guarantee the address and data hold time after the NWE rising edge. Due to the presence of this HCLK cycle, the DATAST value must be greater than zero ( $\text{DATAST} > 0$ ).

Table 73. FMC\_BCRx bitfields (mode 1)

| Bit number | Bit name  | Value to set                                                       |
|------------|-----------|--------------------------------------------------------------------|
| 31:22      | Reserved  | 0x000                                                              |
| 21         | WFDIS     | As needed (this bit is reserved for STM32L47x/L48x devices)        |
| 20         | CCLKEN    | As needed                                                          |
| 19         | CBURSTRW  | 0x0 (no effect in Asynchronous mode)                               |
| 18:16      | CPSIZE    | 0x0 (no effect in Asynchronous mode)                               |
| 15         | ASYNCWAIT | Set to 1 if the memory supports this feature. Otherwise keep at 0. |
| 14         | EXTMOD    | 0x0                                                                |
| 13         | WAITEN    | 0x0 (no effect in Asynchronous mode)                               |
| 12         | WREN      | As needed                                                          |
| 11         | Reserved  | 0x0                                                                |
| 10         | Reserved  | 0x0                                                                |
| 9          | WAITPOL   | Meaningful only if bit 15 is 1                                     |
| 8          | BURSTEN   | 0x0                                                                |
| 7          | Reserved  | 0x1                                                                |
| 6          | FACCEN    | Don't care                                                         |

Table 73. FMC\_BCRx bitfields (mode 1) (continued)

| Bit number | Bit name | Value to set                              |
|------------|----------|-------------------------------------------|
| 5:4        | MWID     | As needed                                 |
| 3:2        | MTYP     | As needed, exclude 0x2 (NOR flash memory) |
| 1          | MUXE     | 0x0                                       |
| 0          | MBKEN    | 0x1                                       |

Table 74. FMC\_BTRx bitfields (mode 1)

| Bit number | Bit name | Value to set                                                                                                         |
|------------|----------|----------------------------------------------------------------------------------------------------------------------|
| 31:30      | Reserved | 0x0                                                                                                                  |
| 29:28      | ACCMOD   | Don't care                                                                                                           |
| 27:24      | DATLAT   | Don't care                                                                                                           |
| 23:20      | CLKDIV   | Don't care                                                                                                           |
| 19:16      | BUSTURN  | Time between NEx high to NEx low (BUSTURN HCLK).                                                                     |
| 15:8       | DATAST   | Duration of the second access phase (DATAST+1 HCLK cycles for write accesses, DATAST HCLK cycles for read accesses). |
| 7:4        | ADDHLD   | Don't care                                                                                                           |
| 3:0        | ADDSET   | Duration of the first access phase (ADDSET HCLK cycles).<br>Minimum value for ADDSET is 0.                           |

Mode A - SRAM/PSRAM (CRAM) OE toggling

Figure 40. Mode A read access waveforms

- 1. NBL[1:0] are driven low during the read access

Figure 41. Mode A write access waveforms

The differences compared with Mode 1 are the toggling of NOE and the independent read and write timings.

**Table 75. FMC\_BCRx bitfields (mode A)**

| Bit number | Bit name  | Value to set                                                       |
|------------|-----------|--------------------------------------------------------------------|
| 31:22      | Reserved  | 0x000                                                              |
| 21         | WFDIS     | As needed (this bit is reserved for STM32L47x/L48x devices)        |
| 20         | CCLKEN    | As needed                                                          |
| 19         | CBURSTRW  | 0x0 (no effect in Asynchronous mode)                               |

### WAIT management in asynchronous accesses

If the asynchronous memory asserts the WAIT signal to indicate that it is not yet ready to accept or to provide data, the ASYNCWAIT bit has to be set in FMC\_BCRx register.

If the WAIT signal is active (high or low depending on the WAITPOL bit), the second access phase (Data setup phase), programmed by the DATAST bits, is extended until WAIT becomes inactive. Unlike the data setup phase, the first access phases (Address setup and Address hold phases), programmed by the ADDSET and ADDHLD bits, are not WAIT sensitive and so they are not prolonged.

The data setup phase must be programmed so that WAIT can be detected 4 HCLK cycles before the end of the memory transaction. The following cases must be considered:

1. The memory asserts the WAIT signal aligned to NOE/NWE which toggles:

$$\text{DATAST} \geq (4 \times \text{HCLK}) + \text{max\_wait\_assertion\_time}$$

2. The memory asserts the WAIT signal aligned to NEx (or NOE/NWE not toggling):  
if

$$\text{max\_wait\_assertion\_time} > \text{address\_phase} + \text{hold\_phase}$$

then:

$$\text{DATAST} \geq (4 \times \text{HCLK}) + (\text{max\_wait\_assertion\_time} - \text{address\_phase} - \text{hold\_phase})$$

otherwise

$$\text{DATAST} \geq 4 \times \text{HCLK}$$

where max\_wait\_assertion\_time is the maximum time taken by the memory to assert the WAIT signal once NEx/NOE/NWE is low.

Figure 51 and Figure 52 show the number of HCLK clock cycles that are added to the memory access phase after WAIT is released by the asynchronous memory (independently of the above cases).

**Figure 51. Asynchronous wait during a read access waveforms**

1. NWAIT polarity depends on WAITPOL bit setting in FMC\_BCRx register.

Figure 52. Asynchronous wait during a write access waveforms

1. NWAIT polarity depends on WAITPOL bit setting in FMC\_BCRx register.

### 16.6.5 Synchronous transactions

The memory clock, FMC\_CLK, is a submultiple of HCLK. It depends on the value of CLKDIV and the MWID/ AHB data size, following the formula given below:

$$\text{FMC\_CLK divider ratio} = \max(\text{CLKDIV} + 1, \text{MWID}(\text{AHB data size}))$$

Whatever MWID size: 16 or 8-bit, the FMC\_CLK divider ratio is always defined by the programmed CLKDIV value.

Example:

- If CLKDIV=1, MWID = 16 bits, AHB data size=8 bits, FMC\_CLK=HCLK/2.

NOR flash memories specify a minimum time from NADV assertion to CLK high. To meet this constraint, the FMC does not issue the clock to the memory during the first internal clock cycle of the synchronous access (before NADV assertion). This guarantees that the rising edge of the memory clock occurs in the middle of the NADV low pulse.

#### Data latency versus NOR memory latency

The data latency is the number of cycles to wait before sampling the data. The DATLAT value must be consistent with the latency value specified in the NOR flash configuration register. The FMC does not include the clock cycle when NADV is low in the data latency count.

**Caution:** Some NOR flash memories include the NADV Low cycle in the data latency count, so that the exact relation between the NOR flash latency and the FMC DATLAT parameter can be either:

- NOR flash latency = (DATLAT + 2) CLK clock cycles
- or NOR flash latency = (DATLAT + 3) CLK clock cycles

Some recent memories assert NWAIT during the latency phase. In such cases DATLAT can be set to its minimum value. As a result, the FMC samples the data and waits long enough to evaluate if the data are valid. Thus the FMC detects when the memory exits latency and real data are processed.

Other memories do not assert NWAIT during latency. In this case the latency must be set correctly for both the FMC and the memory, otherwise invalid data are mistaken for good data, or valid data are lost in the initial phase of the memory access.

### Single-burst transfer

When the selected bank is configured in Burst mode for synchronous accesses, if for example an AHB single-burst transaction is requested on 16-bit memories, the FMC performs a burst transaction of length 1 (if the AHB transfer is 16 bits), or length 2 (if the AHB transfer is 32 bits) and de-assert the chip select signal when the last data is strobed.

Such transfers are not the most efficient in terms of cycles compared to asynchronous read operations. Nevertheless, a random asynchronous access would first require to re-program the memory access mode, which would altogether last longer.

### Cross boundary page for CellularRAM™ 1.5

CellularRAM™ 1.5 does not allow burst access to cross the page boundary. The FMC controller is used to split automatically the burst access when the memory page size is reached by configuring the CPSIZE bits in the FMC\_BCR1 register following the memory page size.

### Wait management

For synchronous NOR flash memories, NWAIT is evaluated after the programmed latency period, which corresponds to (DATLAT+2) CLK clock cycles.

If NWAIT is active (low level when WAITPOL = 0, high level when WAITPOL = 1), wait states are inserted until NWAIT is inactive (high level when WAITPOL = 0, low level when WAITPOL = 1).

When NWAIT is inactive, the data is considered valid either immediately (bit WAITCFG = 1) or on the next clock edge (bit WAITCFG = 0).

During wait-state insertion via the NWAIT signal, the controller continues to send clock pulses to the memory, keeping the chip select and output enable signals valid. It does not consider the data as valid.

In Burst mode, there are two timing configurations for the NOR flash NWAIT signal:

- The flash memory asserts the NWAIT signal one data cycle before the wait state (default after reset).
- The flash memory asserts the NWAIT signal during the wait state

The FMC supports both NOR flash wait state configurations, for each chip select, thanks to the WAITCFG bit in the FMC\_BCRx registers (x = 0..3).

Figure 53. Wait configuration waveforms

Figure 54. Synchronous multiplexed read mode waveforms - NOR, PSRAM (CRAM)

1. Byte lane outputs (NBL are not shown; for NOR access, they are held high, and, for PSRAM (CRAM) access, they are held low.

## 16.6.6 NOR/PSRAM controller registers

### SRAM/NOR-flash chip-select control register for bank x (FMC\_BCRx) (x = 1 to 4)

Address offset:  $0x00 + 0x8 * (x - 1)$ , (x = 1 to 4)

Reset value: 0x0000 30DB, 0x0000 30D2, 0x0000 30D2, 0x0000 30D2

This register contains the control information of each memory bank, used for SRAMs, PSRAM and NOR flash memories.

|               |            |            |      |             |      |             |             |      |            |           |            |              |             |           |           |
|---------------|------------|------------|------|-------------|------|-------------|-------------|------|------------|-----------|------------|--------------|-------------|-----------|-----------|

| rw            | rw         | rw         | rw   | rw          |      | rw          | rw          |      | rw         | rw        | rw         | rw           | rw          | rw        | rw        |

Bits 31:22 Reserved, must be kept at reset value.

**Bit 21 WFDIS:** Write FIFO disable

This bit disables the Write FIFO used by the FMC controller.

0: Write FIFO enabled (Default after reset)

1: Write FIFO disabled

*Note: This bit is reserved for STM32L47x/L48x devices.*

*Note: The WFDIS bit of the FMC\_BCR2..4 registers is don't care. It is only enabled through the FMC\_BCR1 register.*

**Bit 20 CCLKEN:** Continuous clock enable

This bit enables the FMC\_CLK clock output to external memory devices.

0: The FMC\_CLK is only generated during the synchronous memory access (read/write transaction). The FMC\_CLK clock ratio is specified by the programmed CLKDIV value in the FMC\_BCRx register (default after reset).

1: The FMC\_CLK is generated continuously during asynchronous and synchronous access. The FMC\_CLK clock is activated when the CCLKEN is set.

*Note: The CCLKEN bit of the FMC\_BCR2..4 registers is don't care. It is only enabled through the FMC\_BCR1 register. Bank 1 must be configured in Synchronous mode to generate the FMC\_CLK continuous clock.*

*Note: If CCLKEN bit is set, the FMC\_CLK clock ratio is specified by CLKDIV value in the FMC\_BTR1 register. CLKDIV in FMC\_BWTR1 is don't care.*

*Note: If the Synchronous mode is used and CCLKEN bit is set, the synchronous memories connected to other banks than Bank 1 are clocked by the same clock (the CLKDIV value in the FMC\_BTR2..4 and FMC\_BWTR2..4 registers for other banks has no effect.)*

**Bit 19 CBURSTRW:** Write burst enable

For PSRAM (CRAM) operating in Burst mode, the bit enables synchronous accesses during write operations. The enable bit for synchronous read accesses is the BURSTEN bit in the FMC\_BCRx register.

0: Write operations are always performed in Asynchronous mode.

1: Write operations are performed in Synchronous mode.

Bits 18:16 **CPSIZE[2:0]**: CRAM page size

These are used for CellularRAM™ 1.5 which does not allow burst access to cross the address boundaries between pages. When these bits are configured, the FMC controller splits automatically the burst access when the memory page size is reached (refer to memory datasheet for page size).

000: No burst split when crossing page boundary (default after reset)

001: 128 bytes

010: 256 bytes

011: 512 bytes

100: 1024 bytes

Others: Reserved, must not be used

Bit 15 **ASYNCAWAIT**: Wait signal during asynchronous transfers

This bit enables/disables the FMC to use the wait signal even during an asynchronous protocol.

0: NWAIT signal is not taken in to account when running an asynchronous protocol (default after reset).

1: NWAIT signal is taken in to account when running an asynchronous protocol.

Bit 14 **EXTMOD**: Extended mode enable

This bit enables the FMC to program the write timings for non multiplexed asynchronous accesses inside the FMC\_BWTR register, thus resulting in different timings for read and write operations.

0: values inside FMC\_BWTR register are not taken into account (default after reset)

1: values inside FMC\_BWTR register are taken into account

*Note: When the Extended mode is disabled, the FMC can operate in mode 1 or mode 2 as follows:*

- *Mode 1 is the default mode when the SRAM/PSRAM memory type is selected (MTYP = 0x0 or 0x01)*
- *Mode 2 is the default mode when the NOR memory type is selected (MTYP = 0x10).*

Bit 13 **WAITEN**: Wait enable bit

This bit enables/disables wait-state insertion via the NWAIT signal when accessing the memory in Synchronous mode.

0: NWAIT signal is disabled (its level not taken into account, no wait state inserted after the programmed flash latency period).

1: NWAIT signal is enabled (its level is taken into account after the programmed latency period to insert wait states if asserted) (default after reset).

Bit 12 **WREN**: Write enable bit

This bit indicates whether write operations are enabled/disabled in the bank by the FMC.

0: Write operations are disabled in the bank by the FMC, an AHB error is reported.

1: Write operations are enabled for the bank by the FMC (default after reset).

Bit 11 **WAITCFG**: Wait timing configuration

The NWAIT signal indicates whether the data from the memory are valid or if a wait state must be inserted when accessing the memory in Synchronous mode. This configuration bit determines if NWAIT is asserted by the memory one clock cycle before the wait state or during the wait state:

0: NWAIT signal is active one data cycle before wait state (default after reset).

1: NWAIT signal is active during wait state (not used for PSRAM).

Bit 10 Reserved, must be kept at reset value.

Bit 9 **WAITPOL**: Wait signal polarity bit

Defines the polarity of the wait signal from memory used for either in Synchronous or Asynchronous mode.

0: NWAIT active low (default after reset)

1: NWAIT active high

Bit 8 **BURSTEN**: Burst enable bit

This bit enables/disables synchronous accesses during read operations. It is valid only for synchronous memories operating in Burst mode.

- 0: Burst mode disabled (default after reset). Read accesses are performed in Asynchronous mode.
- 1: Burst mode enable. Read accesses are performed in Synchronous mode.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FACCEN**: Flash access enable

Enables NOR flash memory access operations.

- 0: Corresponding NOR flash memory access is disabled.
- 1: Corresponding NOR flash memory access is enabled (default after reset).

Bits 5:4 **MWID[1:0]**: Memory data bus width

Defines the external memory device width, valid for all type of memories.

- 00: 8 bits
- 01: 16 bits (default after reset)
- 10: reserved
- 11: reserved

Bits 3:2 **MTYP[1:0]**: Memory type

Defines the type of external memory attached to the corresponding memory bank.

- 00: SRAM (default after reset for Bank 2...4)
- 01: PSRAM (CRAM)
- 10: NOR flash/OneNAND flash (default after reset for Bank 1)
- 11: reserved

Bit 1 **MUXEN**: Address/data multiplexing enable bit

When this bit is set, the address and data values are multiplexed on the data bus, valid only with NOR and PSRAM memories:

- 0: Address/data non multiplexed
- 1: Address/data multiplexed on databus (default after reset)

Bit 0 **MBKEN**: Memory bank enable bit

Enables the memory bank. After reset Bank1 is enabled, all others are disabled. Accessing a disabled bank causes an ERROR on AHB bus.

- 0: Corresponding memory bank is disabled.
- 1: Corresponding memory bank is enabled.

**SRAM/NOR-flash chip-select timing register for bank x (FMC\_BTRx)**

Address offset:  $0x04 + 0x8 * (x - 1)$ , ( $x = 1$  to  $4$ )

Reset value: 0x0FFF FFFF

This register contains the control information of each memory bank, used for SRAMs, PSRAM and NOR flash memories. If the EXTMOD bit is set in the FMC\_BCRx register, then this register is partitioned for write and read access, that is, 2 registers are available: one to

configure read accesses (this register) and one to configure write accesses (FMC\_BWTRx registers).

|             |      |             |    |             |    |    |    |             |    |    |    |              |    |    |    |

| DATAST[7:0] |      |             |    |             |    |    |    | ADDHLD[3:0] |    |    |    | ADDSET[3:0]  |    |    |    |
| rw          | rw   | rw          | rw | rw          | rw | rw | rw | rw          | rw | rw | rw | rw           | rw | rw | rw |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **ACCMOD[1:0]**: Access mode

Specifies the asynchronous access modes as shown in the timing diagrams. These bits are taken into account only when the EXTMOD bit in the FMC\_BCRx register is 1.

00: Access mode A  
 01: Access mode B  
 10: Access mode C  
 11: Access mode D

Bits 27:24 **DATLAT[3:0]**: (see note below bit descriptions): Data latency for synchronous memory

For synchronous access with read/write Burst mode enabled (BURSTEN / CBURSTRW bits set), defines the number of memory clock cycles (+2) to issue to the memory before reading/writing the first data:

This timing parameter is not expressed in HCLK periods, but in FMC\_CLK periods.

For asynchronous access, this value is don't care.

0000: Data latency of 2 CLK clock cycles for first burst access

1111: Data latency of 17 CLK clock cycles for first burst access (default value after reset)

Bits 23:20 **CLKDIV[3:0]**: Clock divide ratio (for FMC\_CLK signal)

Defines the period of FMC\_CLK clock output signal, expressed in number of HCLK cycles:

0000: Reserved

0001: FMC\_CLK period = 2 × HCLK periods

0010: FMC\_CLK period = 3 × HCLK periods

1111: FMC\_CLK period = 16 × HCLK periods (default value after reset)

In asynchronous NOR flash, SRAM or PSRAM accesses, this value is don't care.

*Note:* Refer to [Section 16.6.5: Synchronous transactions](#) for FMC\_CLK divider ratio formula)

Bits 19:16 **BUSTURN[3:0]**: Bus turnaround phase duration

These bits are written by software to add a delay at the end of a write-to-read (and read-to-write) transaction. This delay enables to match the minimum time between consecutive transactions (tEHEL from NEx high to NEx low) and the maximum time needed by the memory to free the data bus after a read access (tEHQZ). The programmed bus turnaround delay is inserted between an asynchronous read (muxed or mode D) or write transaction and any other asynchronous /synchronous read or write to or from a static bank. The bank can be the same or different in case of read, in case of write the bank can be different except for muxed or mode D.

In some cases, whatever the programmed BUSTURN values, the bus turnaround delay is fixed

as follows:

- The bus turnaround delay is not inserted between two consecutive asynchronous write transfers to the same static memory bank except for muxed mode and mode D.
- There is a bus turnaround delay of 1 HCLK clock cycle between:
  - Two consecutive asynchronous read transfers to the same static memory bank except for muxed mode and mode D.
  - An asynchronous read to an asynchronous or synchronous write to any static bank or dynamic bank except for muxed mode and mode D.
  - An asynchronous (modes 1, 2, A, B or C) read and a read from another static bank.
- There is a bus turnaround delay of 2 HCLK clock cycle between:
  - Two consecutive synchronous writes (burst or single) to the same bank.
  - A synchronous write (burst or single) access and an asynchronous write or read transfer to or from static memory bank (the bank can be the same or different for the case of read).
  - Two consecutive synchronous reads (burst or single) followed by any synchronous/asynchronous read or write from/to another static memory bank.
- There is a bus turnaround delay of 3 HCLK clock cycle between:
  - Two consecutive synchronous writes (burst or single) to different static bank.
  - A synchronous write (burst or single) access and a synchronous read from the same or a different bank.

0000: BUSTURN phase duration = 0 HCLK clock cycle added

...

1111: BUSTURN phase duration = 15 x HCLK clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]**: Data-phase duration

These bits are written by software to define the duration of the data phase (refer to [Figure 38](#) to [Figure 50](#)), used in asynchronous accesses:

0000 0000: Reserved

0000 0001: DATAST phase duration = 1 x HCLK clock cycles

0000 0010: DATAST phase duration = 2 x HCLK clock cycles

...

1111 1111: DATAST phase duration = 255 x HCLK clock cycles (default value after reset)

For each memory type and access mode data-phase duration, refer to the respective figure ([Figure 38](#) to [Figure 50](#)).

Example: Mode 1, write access, DATAST=1: Data-phase duration= DATAST+1 = 2 HCLK clock cycles.

*Note: In synchronous accesses, this value is don't care.*

Bits 7:4 **ADDHLD[3:0]**: Address-hold phase duration

These bits are written by software to define the duration of the *address hold* phase (refer to [Figure 38](#) to [Figure 50](#)), used in mode D or multiplexed accesses:

0000: Reserved

0001: ADDHLD phase duration = 1 × HCLK clock cycle

0010: ADDHLD phase duration = 2 × HCLK clock cycle

...

1111: ADDHLD phase duration = 15 × HCLK clock cycles (default value after reset)

For each access mode address-hold phase duration, refer to the respective figure ([Figure 38](#) to [Figure 50](#)).

*Note: In synchronous accesses, this value is not used, the address hold phase is always 1 memory clock period duration.*

Bits 3:0 **ADDSET[3:0]**: Address setup phase duration

These bits are written by software to define the duration of the *address setup* phase (refer to [Figure 38](#) to [Figure 50](#)), used in SRAMs, ROMs, asynchronous NOR flash and PSRAM:

0000: ADDSET phase duration = 0 × HCLK clock cycle

...

1111: ADDSET phase duration = 15 × HCLK clock cycles (default value after reset)

For each access mode address setup phase duration, refer to the respective figure ([Figure 38](#) to [Figure 50](#)).

*Note: In synchronous accesses, this value is don't care.*

*In Muxed mode or mode D, the minimum value for ADDSET is 1.*

*In mode 1 and PSRAM memory, the minimum value for ADDSET is 1.*

*Note: PSRAMs (CRAMs) have a variable latency due to internal refresh. Therefore these memories issue the NWAIT signal during the whole latency phase to prolong the latency as needed.*

*With PSRAMs (CRAMs) the filled DATLAT must be set to 0, so that the FMC exits its latency phase soon and starts sampling NWAIT from memory, then starts to read or write when the memory is ready.*

*This method can be used also with the latest generation of synchronous flash memories that issue the NWAIT signal, unlike older flash memories (check the datasheet of the specific flash memory being used).*

### SRAM/NOR-flash write timing registers x (FMC\_BWTRx)

Address offset: 0x104 + 0x8 \* (x - 1), (x = 1 to 4)

Reset value: 0x0FFF FFFF

This register contains the control information of each memory bank. It is used for SRAMs, PSRAMs and NOR flash memories. When the EXTMOD bit is set in the FMC\_BCRx register, then this register is active for write access.

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **ACCMOD[1:0]**: Access mode.

Specifies the asynchronous access modes as shown in the next timing diagrams. These bits are taken into account only when the EXTMOD bit in the FMC\_BCRx register is 1.

00: Access mode A

01: Access mode B

10: Access mode C

11: Access mode D

Bits 27:20 Reserved, must be kept at reset value.

Bits 19:16 **BUSTURN[3:0]**: Bus turnaround phase duration

The programmed bus turnaround delay is inserted between an asynchronous write transfer and any other asynchronous /synchronous read or write transfer to or from a static bank. The bank can be the same or different in case of read, in case of write the bank can be different except for muxed or mode D.

In some cases, whatever the programmed BUSTURN values, the bus turnaround delay is fixed as follows:

- The bus turnaround delay is not inserted between two consecutive asynchronous write transfers to the same static memory bank except for muxed and D modes.
- There is a bus turnaround delay of 2 HCLK clock cycle between:
  - Two consecutive synchronous writes (burst or single) to the same bank.
  - A synchronous write (burst or single) transfer and an asynchronous write or read transfer to or from static memory bank.
- There is a bus turnaround delay of 3 HCLK clock cycle between:
  - Two consecutive synchronous writes (burst or single) to different static bank.
  - A synchronous write (burst or single) transfer and a synchronous read from the same or a different bank.

0000: BUSTURN phase duration = 0 HCLK clock cycle added

...

1111: BUSTURN phase duration = 15 HCLK clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]**: Data-phase duration.

These bits are written by software to define the duration of the data phase (refer to [Figure 38](#) to [Figure 50](#)), used in asynchronous SRAM, PSRAM and NOR flash memory accesses:

0000 0000: Reserved

0000 0001: DATAST phase duration = 1 × HCLK clock cycles

0000 0010: DATAST phase duration = 2 × HCLK clock cycles

...

1111 1111: DATAST phase duration = 255 × HCLK clock cycles (default value after reset)

Bits 7:4 **ADDHLD[3:0]**: Address-hold phase duration.

These bits are written by software to define the duration of the *address hold* phase (refer to [Figure 47](#) to [Figure 50](#)), used in asynchronous multiplexed accesses:

0000: Reserved

0001: ADDHLD phase duration = 1 × HCLK clock cycle

0010: ADDHLD phase duration = 2 × HCLK clock cycle

...

1111: ADDHLD phase duration = 15 × HCLK clock cycles (default value after reset)

*Note: In synchronous NOR flash accesses, this value is not used, the address hold phase is always 1 flash clock period duration.*

Bits 3:0 **ADDSET[3:0]**: Address setup phase duration.

These bits are written by software to define the duration of the *address setup* phase in HCLK cycles (refer to [Figure 38](#) to [Figure 50](#)), used in asynchronous accesses:

0000: ADDSET phase duration = 0 × HCLK clock cycle

...

1111: ADDSET phase duration = 15 × HCLK clock cycles (default value after reset)

*Note:* In synchronous accesses, this value is not used, the address setup phase is always 1 flash clock period duration. In muxed mode, the minimum ADDSET value is 1.

## 16.7 NAND flash controller

The FMC generates the appropriate signal timings to drive the following types of device:

- 8- and 16-bit NAND flash memories

The NAND bank is configured through dedicated registers ([Section 16.7.7](#)). The programmable memory parameters include access timings (shown in [Table 93](#)) and ECC configuration.

**Table 93. Programmable NAND flash access parameters**

| Parameter             | Function                                                                                                                                                | Access mode | Unit                   | Min. | Max. |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|------------------------|------|------|
| Memory setup time     | Number of clock cycles (HCLK) required to set up the address before the command assertion                                                               | Read/Write  | AHB clock cycle (HCLK) | 1    | 255  |
| Memory wait           | Minimum duration (in HCLK clock cycles) of the command assertion                                                                                        | Read/Write  | AHB clock cycle (HCLK) | 2    | 255  |
| Memory hold           | Number of clock cycles (HCLK) during which the address must be held (as well as the data if a write access is performed) after the command de-assertion | Read/Write  | AHB clock cycle (HCLK) | 1    | 254  |
| Memory databus high-Z | Number of clock cycles (HCLK) during which the data bus is kept in high-Z state after a write access has started                                        | Write       | AHB clock cycle (HCLK) | 1    | 255  |

### 16.7.1 External memory interface signals

The following tables list the signals that are typically used to interface NAND flash memory.

*Note:* The prefix “N” identifies the signals which are active low.

#### 8-bit NAND flash memory

**Table 94. 8-bit NAND flash**

| FMC signal name | I/O | Function                                     |
|-----------------|-----|----------------------------------------------|
| A[17]           | O   | NAND flash address latch enable (ALE) signal |
| A[16]           | O   | NAND flash command latch enable (CLE) signal |

**Table 94. 8-bit NAND flash (continued)**

| FMC signal name | I/O | Function                                             |
|-----------------|-----|------------------------------------------------------|
| D[7:0]          | I/O | 8-bit multiplexed, bidirectional address/data bus    |
| NCE             | O   | Chip select                                          |
| NOE(= NRE)      | O   | Output enable (memory signal name: read enable, NRE) |
| NWE             | O   | Write enable                                         |
| NWAIT/INT       | I   | NAND flash ready/busy input signal to the FMC        |

Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

### 16-bit NAND flash memory

**Table 95. 16-bit NAND flash**

| FMC signal name | I/O | Function                                             |
|-----------------|-----|------------------------------------------------------|
| A[17]           | O   | NAND flash address latch enable (ALE) signal         |
| A[16]           | O   | NAND flash command latch enable (CLE) signal         |
| D[15:0]         | I/O | 16-bit multiplexed, bidirectional address/data bus   |
| NCE             | O   | Chip select                                          |
| NOE(= NRE)      | O   | Output enable (memory signal name: read enable, NRE) |
| NWE             | O   | Write enable                                         |
| NWAIT/INT       | I   | NAND flash ready/busy input signal to the FMC        |

Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

## 16.7.2 NAND flash supported memories and transactions

*Table 96 shows the supported devices, access modes and transactions. Transactions not allowed (or not supported) by the NAND flash controller are shown in gray.*

**Table 96. Supported memories and transactions**

| Device     | Mode         | R/W | AHB data size | Memory data size | Allowed/not allowed | Comments                  |
|------------|--------------|-----|---------------|------------------|---------------------|---------------------------|
| NAND 8-bit | Asynchronous | R   | 8             | 8                | Y                   | -                         |
|            | Asynchronous | W   | 8             | 8                | Y                   | -                         |
|            | Asynchronous | R   | 16            | 8                | Y                   | Split into 2 FMC accesses |
|            | Asynchronous | W   | 16            | 8                | Y                   | Split into 2 FMC accesses |
|            | Asynchronous | R   | 32            | 8                | Y                   | Split into 4 FMC accesses |
|            | Asynchronous | W   | 32            | 8                | Y                   | Split into 4 FMC accesses |

**Table 96. Supported memories and transactions (continued)**

| Device      | Mode         | R/W | AHB data size | Memory data size | Allowed/not allowed | Comments                  |
|-------------|--------------|-----|---------------|------------------|---------------------|---------------------------|
| NAND 16-bit | Asynchronous | R   | 8             | 16               | Y                   | -                         |
|             | Asynchronous | W   | 8             | 16               | N                   | -                         |
|             | Asynchronous | R   | 16            | 16               | Y                   | -                         |
|             | Asynchronous | W   | 16            | 16               | Y                   | -                         |
|             | Asynchronous | R   | 32            | 16               | Y                   | Split into 2 FMC accesses |
|             | Asynchronous | W   | 32            | 16               | Y                   | Split into 2 FMC accesses |

### 16.7.3 Timing diagrams for NAND flash memory

The NAND flash memory bank is managed through a set of registers:

- Control register: FMC\_PCR
- Interrupt status register: FMC\_SR
- ECC register: FMC\_ECCR
- Timing register for Common memory space: FMC\_PMEM
- Timing register for Attribute memory space: FMC\_PATT

Each timing configuration register contains three parameters used to define number of HCLK cycles for the three phases of any NAND flash access, plus one parameter that defines the timing for starting driving the data bus when a write access is performed.

[Figure 56](#) shows the timing parameter definitions for common memory accesses, knowing that Attribute memory space access timings are similar.

**Figure 56. NAND flash controller waveforms for common memory access**

1. NOE remains high (inactive) during write accesses. NWE remains high (inactive) during read accesses.
2. For write access, the hold phase delay is (MEMHOLD) HCLK cycles and for read access is (MEMHOLD + 2) HCLK cycles.

## 16.7.4 NAND flash operations

The command latch enable (CLE) and address latch enable (ALE) signals of the NAND flash memory device are driven by address signals from the FMC controller. This means that to send a command or an address to the NAND flash memory, the CPU has to perform a write to a specific address in its memory space.

A typical page read operation from the NAND flash device requires the following steps:

1. Program and enable the corresponding memory bank by configuring the FMC\_PCR and FMC\_PMEM (and for some devices, FMC\_PATT, see [Section 16.7.5: NAND flash prewait functionality](#)) registers according to the characteristics of the NAND flash memory (PWID bits for the data bus width of the NAND flash, PTYP = 1, PWAITEN = 0 or 1 as needed, see [Section 16.5.2: NAND flash memory address mapping](#) for timing configuration).
2. The CPU performs a byte write to the common memory space, with data byte equal to one flash command byte (for example 0x00 for Samsung NAND flash devices). The LE input of the NAND flash memory is active during the write strobe (low pulse on NWE), thus the written byte is interpreted as a command by the NAND flash memory. Once the command is latched by the memory device, it does not need to be written again for the following page read operations.
3. The CPU can send the start address (STARTAD) for a read operation by writing four bytes (or three for smaller capacity devices), STARTAD[7:0], STARTAD[16:9], STARTAD[24:17] and finally STARTAD[25] (for 64 Mb x 8 bit NAND flash memories) in the common memory or attribute space. The ALE input of the NAND flash device is active during the write strobe (low pulse on NWE), thus the written bytes are interpreted as the start address for read operations. Using the attribute memory space makes it possible to use a different timing configuration of the FMC, which can be used to implement the prewait functionality needed by some NAND flash memories (see details in [Section 16.7.5: NAND flash prewait functionality](#)).
4. The controller waits for the NAND flash memory to be ready (R/NB signal high), before starting a new access to the same or another memory bank. While waiting, the controller holds the NCE signal active (low).
5. The CPU can then perform byte read operations from the common memory space to read the NAND flash page (data field + Spare field) byte by byte.
6. The next NAND flash page can be read without any CPU command or address write operation. This can be done in three different ways:
  - by simply performing the operation described in step 5
  - a new random address can be accessed by restarting the operation at step 3
  - a new command can be sent to the NAND flash device by restarting at step 2

## 16.7.5 NAND flash prewait functionality

Some NAND flash devices require that, after writing the last part of the address, the controller waits for the R/NB signal to go low. (see [Figure 57](#)).

Figure 57. Access to non 'CE don't care' NAND-flash

1. CPU wrote byte 0x00 at address 0x7001 0000.
2. CPU wrote byte A7~A0 at address 0x7002 0000.
3. CPU wrote byte A16~A9 at address 0x7002 0000.
4. CPU wrote byte A24~A17 at address 0x7002 0000.
5. CPU wrote byte A25 at address 0x7802 0000: FMC performs a write access using FMC\_PATT timing definition, where  $ATTHOLD \geq 7$  (providing that  $(7+1) \times HCLK = 112 \text{ ns} > t_{WB \text{ max}}$ ). This guarantees that NCE remains low until R/NB goes low and high again (only requested for NAND flash memories where NCE is not don't care).

When this functionality is required, it can be ensured by programming the MEMHOLD value to meet the  $t_{WB}$  timing. However any CPU read access to the NAND flash memory has a hold delay of (MEMHOLD + 2) HCLK cycles and CPU write access has a hold delay of (MEMHOLD) HCLK cycles inserted between the rising edge of the NWE signal and the next access.

To cope with this timing constraint, the attribute memory space can be used by programming its timing register with an ATTHOLD value that meets the  $t_{WB}$  timing, and by keeping the MEMHOLD value at its minimum value. The CPU must then use the common memory space for all NAND flash read and write accesses, except when writing the last address byte to the NAND flash device, where the CPU must write to the attribute memory space.

### 16.7.6 Computation of the error correction code (ECC) in NAND flash memory

The FMC NAND Card controller includes two error correction code computation hardware blocks, one per memory bank. They reduce the host CPU workload when processing the ECC by software.

These two ECC blocks are identical and associated with Bank 2 and Bank 3. As a consequence, no hardware ECC computation is available for memories connected to Bank 4.

The ECC algorithm implemented in the FMC can perform 1-bit error correction and 2-bit error detection per 256, 512, 1 024, 2 048, 4 096 or 8 192 bytes read or written from/to the NAND flash memory. It is based on the Hamming coding algorithm and consists in calculating the row and column parity.

The ECC modules monitor the NAND flash data bus and read/write signals (NCE and NWE) each time the NAND flash memory bank is active.

The ECC operates as follows:

- When accessing NAND flash memory bank 2 or bank 3, the data present on the D[15:0] bus is latched and used for ECC computation.
- When accessing any other address in NAND flash memory, the ECC logic is idle, and does not perform any operation. As a result, write operations to define commands or addresses to the NAND flash memory are not taken into account for ECC computation.

Once the desired number of bytes has been read/written from/to the NAND flash memory by the host CPU, the FMC\_ECCR registers must be read to retrieve the computed value. Once read, they must be cleared by resetting the ECCEN bit to '0'. To compute a new data block, the ECCEN bit must be set to one in the FMC\_PCR registers.

To perform an ECC computation:

1. Enable the ECCEN bit in the FMC\_PCR register.
2. Write data to the NAND flash memory page. While the NAND page is written, the ECC block computes the ECC value.
3. Read the ECC value available in the FMC\_ECCR register and store it in a variable.
4. Clear the ECCEN bit and then enable it in the FMC\_PCR register before reading back the written data from the NAND page. While the NAND page is read, the ECC block computes the ECC value.
5. Read the new ECC value available in the FMC\_ECCR register.
6. If the two ECC values are the same, no correction is required, otherwise there is an ECC error and the software correction routine returns information on whether the error can be corrected or not.

### 16.7.7 NAND flash controller registers

#### NAND flash control registers (FMC\_PCR)

Address offset: 0x80

Reset value: 0x0000 0018

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:17 **ECCPS[2:0]**: ECC page size

Defines the page size for the extended ECC:

000: 256 bytes

001: 512 bytes

010: 1024 bytes

011: 2048 bytes

100: 4096 bytes

101: 8192 bytes

Bits 16:13 **TAR[3:0]**: ALE to RE delay

Sets time from ALE low to RE low in number of AHB clock cycles (HCLK).

Time is:  $t_{ar} = (TAR + SET + 2) \times THCLK$  where THCLK is the HCLK clock period

0000: 1 HCLK cycle (default)

1111: 16 HCLK cycles

*Note: SET is MEMSET or ATTSET according to the addressed space.*

Bits 12:9 **TCLR[3:0]**: CLE to RE delay

Sets time from CLE low to RE low in number of AHB clock cycles (HCLK).

Time is:  $t_{clr} = (TCLR + SET + 2) \times THCLK$  where THCLK is the HCLK clock period

0000: 1 HCLK cycle (default)

1111: 16 HCLK cycles

*Note: SET is MEMSET or ATTSET according to the addressed space.*

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **ECCEN**: ECC computation logic enable bit

0: ECC logic is disabled and reset (default after reset),

1: ECC logic is enabled.

Bits 5:4 **PWID[1:0]**: Data bus width

Defines the external memory device width.

00: 8 bits

01: 16 bits (default after reset).

10: reserved.

11: reserved.

Bit 3 **PTYP**: Memory type

Defines the type of device attached to the corresponding memory bank:

0: Reserved, must be kept at reset value

1: NAND flash (default after reset)

Bit 2 **PBKEN**: NAND flash memory bank enable bit

Enables the memory bank. Accessing a disabled memory bank causes an ERROR on AHB bus

0: Corresponding memory bank is disabled (default after reset)

1: Corresponding memory bank is enabled

Bit 1 **PWAITEN**: Wait feature enable bit

Enables the Wait feature for the NAND flash memory bank:

0: disabled

1: enabled

Bit 0 Reserved, must be kept at reset value.

**FIFO status and interrupt register (FMC\_SR)**

Address offset: 0x84

Reset value: 0x0000 0040

This register contains information about the FIFO status and interrupt. The FMC features a FIFO that is used when writing to memories to transfer up to 16 words of data from the AHB.

This is used to quickly write to the FIFO and free the AHB for transactions to peripherals other than the FMC, while the FMC is draining its FIFO into the memory. One of these register bits indicates the status of the FIFO, for ECC purposes.

The ECC is calculated while the data are written to the memory. To read the correct ECC, the software must consequently wait until the FIFO is empty.

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **FEMPT**: FIFO empty

Read-only bit that provides the status of the FIFO

0: FIFO not empty

1: FIFO empty

Bit 5 **IFEN**: Interrupt falling edge detection enable bit

0: Interrupt falling edge detection request disabled

1: Interrupt falling edge detection request enabled

Bit 4 **ILEN**: Interrupt high-level detection enable bit

0: Interrupt high-level detection request disabled

1: Interrupt high-level detection request enabled

Bit 3 **IREN**: Interrupt rising edge detection enable bit

0: Interrupt rising edge detection request disabled

1: Interrupt rising edge detection request enabled

Bit 2 **IFS**: Interrupt falling edge status

The flag is set by hardware and reset by software.

0: No interrupt falling edge occurred

1: Interrupt falling edge occurred

*Note: If this bit is written by software to 1 it is set.*

Bit 1 **ILS**: Interrupt high-level status

The flag is set by hardware and reset by software.

0: No Interrupt high-level occurred

1: Interrupt high-level occurred

Bit 0 **IRS**: Interrupt rising edge status

The flag is set by hardware and reset by software.

0: No interrupt rising edge occurred

1: Interrupt rising edge occurred

*Note: If this bit is written by software to 1 it is set.*

### Common memory space timing register (FMC\_PMEM)

Address offset: 0x88

Reset value: 0xFCFC FCFC

The FMC\_PMEM read/write register contains the timing information for NAND flash memory bank. This information is used to access either the common memory space of the NAND flash for command, address write access and data read/write access.

|              |    |    |    |    |    |    |    |              |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MEMHIZ[7:0]  |    |    |    |    |    |    |    | MEMHOLD[7:0] |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw           | rw | rw | rw | rw | rw | rw | rw |

| MEMWAIT[7:0] |    |    |    |    |    |    |    | MEMSET[7:0]  |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw           | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **MEMHIZ[7:0]**: Common memory x data bus Hi-Z time

Defines the number of HCLK clock cycles during which the data bus is kept Hi-Z after the start of a NAND flash write access to common memory space on socket. This is only valid for write transactions:

0000 0000: 1 HCLK cycle

1111 1110: 255 HCLK cycles

1111 1111: reserved.

Bits 23:16 **MEMHOLD[7:0]**: Common memory hold time

Defines the number of HCLK clock cycles for write access and HCLK (+2) clock cycles for read access during which the address is held (and data for write accesses) after the command is deasserted (NWE, NOE), for NAND flash read or write access to common memory space on socket x:

0000 0000: reserved.

0000 0001: 1 HCLK cycle for write access / 3 HCLK cycles for read access

1111 1110: 254 HCLK cycles for write access / 256 HCLK cycles for read access

1111 1111: reserved.

Bits 15:8 **MEMWAIT[7:0]**: Common memory wait time

Defines the minimum number of HCLK (+1) clock cycles to assert the command (NWE, NOE), for NAND flash read or write access to common memory space on socket. The duration of command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of HCLK:

0000 0000: reserved

0000 0001: 2HCLK cycles (+ wait cycle introduced by deasserting NWAIT)

1111 1110: 255 HCLK cycles (+ wait cycle introduced by deasserting NWAIT)

1111 1111: reserved.

Bits 7:0 **MEMSET[7:0]**: Common memory x setup time

Defines the number of HCLK (+1) clock cycles to set up the address before the command assertion (NWE, NOE), for NAND flash read or write access to common memory space on socket x:

0000 0000: 1 HCLK cycle

1111 1110: 255 HCLK cycles

1111 1111: reserved

### Attribute memory space timing register (FMC\_PATT)

Address offset: 0x8C

Reset value: 0xFCFC FCFC

The FMC\_PATT read/write register contains the timing information for NAND flash memory bank. It is used for 8-bit accesses to the attribute memory space of the NAND flash for the last address write access if the timing must differ from that of previous accesses (for Ready/Busy management, refer to [Section 16.7.5: NAND flash prewait functionality](#)).

|              |    |    |    |    |    |    |    |              |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ATTHIZ[7:0]  |    |    |    |    |    |    |    | ATTHOLD[7:0] |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw           | rw | rw | rw | rw | rw | rw | rw |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ATTWAIT[7:0] |    |    |    |    |    |    |    | ATTSET[7:0]  |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw           | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **ATTHIZ[7:0]**: Attribute memory data bus Hi-Z time

Defines the number of HCLK clock cycles during which the data bus is kept in Hi-Z after the start of a NAND flash write access to attribute memory space on socket. Only valid for writ transaction:

0000 0000: 0 HCLK cycle

1111 1110: 255 HCLK cycles

1111 1111: reserved.

Bits 23:16 **ATTHOLD[7:0]**: Attribute memory hold time

Defines the number of HCLK clock cycles for write access and HCLK (+2) clock cycles for read access during which the address is held (and data for write access) after the command deassertion (NWE, NOE), for NAND flash read or write access to attribute memory space on socket:

0000 0000: reserved

0000 0001: 1 HCLK cycle for write access / 3 HCLK cycles for read access

1111 1110: 254 HCLK cycles for write access / 256 HCLK cycles for read access

1111 1111: reserved.

Bits 15:8 **ATTWAIT[7:0]**: Attribute memory wait time

Defines the minimum number of HCLK (+1) clock cycles to assert the command (NWE, NOE), for NAND flash read or write access to attribute memory space on socket x. The duration for command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of HCLK:

0000 0000: reserved

0000 0001: 2 HCLK cycles (+ wait cycle introduced by deassertion of NWAIT)

1111 1110: 255 HCLK cycles (+ wait cycle introduced by deasserting NWAIT)

1111 1111: reserved.

Bits 7:0 **ATTSET[7:0]**: Attribute memory setup time

Defines the number of HCLK (+1) clock cycles to set up address before the command assertion (NWE, NOE), for NAND flash read or write access to attribute memory space on socket:

0000 0000: 1 HCLK cycle

1111 1110: 255 HCLK cycles

1111 1111: reserved.

### ECC result registers (FMC\_ECCR)

Address offset: 0x94

Reset value: 0x0000 0000

This register contains the current error correction code value computed by the ECC computation modules of the FMC NAND controller. When the CPU reads the data from a NAND flash memory page at the correct address (refer to [Section 16.7.6: Computation of the error correction code \(ECC\) in NAND flash memory](#)), the data read/written from/to the NAND flash memory are processed automatically by the ECC computation module. When X bytes have been read (according to the ECCPS field in the FMC\_PCR registers), the CPU must read the computed ECC value from the FMC\_ECC registers. It then verifies if these computed parity data are the same as the parity value recorded in the spare area, to determine whether a page is valid, and, to correct it otherwise. The FMC\_ECCR register must be cleared after being read by setting the ECCEN bit to 0. To compute a new data block, the ECCEN bit must be set to 1.

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 17 Quad-SPI interface (QUADSPI)

### 17.1 Introduction

The QUADSPI is a specialized communication interface targeting single, dual- or quad-SPI flash memories. It can operate in any of the three following modes:

- indirect mode: all the operations are performed using the QUADSPI registers.
- automatic status-polling mode: the external flash memory status register is periodically read and an interrupt can be generated in case of flag setting.
- memory-mapped mode: the external flash memory is mapped to the device address space and is seen by the system as if it was an internal memory.

Both throughput and capacity can be increased two-fold using dual-flash mode, where two Quad-SPI flash memories are accessed simultaneously.

### 17.2 QUADSPI main features

- Three functional modes: indirect, automatic status-polling, and memory-mapped
- Dual-flash mode, where 8 bits can be sent/received simultaneously by accessing two flash memories in parallel
- SDR and DDR support
- Fully programmable opcode for both indirect and memory-mapped modes
- Fully programmable frame format for both indirect and memory-mapped modes
- Integrated FIFO for reception and transmission
- 8-, 16-, and 32-bit data accesses allowed
- DMA channel for indirect mode operations
- Interrupt generation on FIFO threshold, timeout, operation complete, and access error

### 17.3 QUADSPI implementation

This section describes the full set of features implemented in the QUADSPI.

The table below describes the feature differences between microcontroller families.

**Table 99. QUADSPI implementation<sup>(1)</sup>**

| QUADSPI features | STM32L49x/L4Ax devices | STM32L47x/L48x devices |
|------------------|------------------------|------------------------|
| Dual-flash mode  | X                      | -                      |
| DHHC (DDR hold)  | X                      | -                      |

1. X = supported

## 17.4 QUADSPI functional description

### 17.4.1 QUADSPI block diagram

Figure 58. QUADSPI block diagram when dual-flash mode is disabled

Figure 59. QUADSPI block diagram when dual-flash mode is enabled

### 17.4.2 QUADSPI pins

The table below lists the QUADSPI pins, six for interfacing with a single flash memory, or 10 to 11 for interfacing with two flash memories (FLASH 1 and FLASH 2) in dual-flash mode.

Table 100. QUADSPI pins

| Signal name | Signal type          | Description                                                                       |
|-------------|----------------------|-----------------------------------------------------------------------------------|
| CLK         | Digital output       | Clock to FLASH 1 and FLASH 2                                                      |
| BK1_IO0/SO  | Digital input/output | Bidirectional I/O in dual/quad modes or serial output in single mode, for FLASH 1 |
| BK1_IO1/SI  | Digital input/output | Bidirectional I/O in dual/quad modes or serial input in single mode, for FLASH 1  |

Table 100. QUADSPI pins (continued)

| Signal name | Signal type          | Description                                                                                                      |
|-------------|----------------------|------------------------------------------------------------------------------------------------------------------|
| BK1_IO2     | Digital input/output | Bidirectional I/O in quad mode, for FLASH 1                                                                      |
| BK1_IO3     | Digital input/output | Bidirectional I/O in quad mode, for FLASH 1                                                                      |
| BK2_IO0/SO  | Digital input/output | Bidirectional I/O in dual/quad modes or serial output in single mode, for FLASH 2                                |
| BK2_IO1/SI  | Digital input/output | Bidirectional I/O in dual/quad modes or serial input in single mode, for FLASH 2                                 |
| BK2_IO2     | Digital input/output | Bidirectional I/O in quad mode, for FLASH 2                                                                      |
| BK2_IO3     | Digital input/output | Bidirectional I/O in quad mode, for FLASH 2                                                                      |
| BK1_NCS     | Digital output       | Chip select (active low) for FLASH 1. Can also be used for FLASH 2 if QUADSPI is always used in dual-flash mode. |
| BK2_NCS     | Digital output       | Chip select (active low) for FLASH 2. Can also be used for FLASH 1 if QUADSPI is always used in dual-flash mode. |

### 17.4.3 QUADSPI command sequence

The QUADSPI communicates with the flash memory using commands. Each command can include five phases: instruction, address, alternate byte, dummy, data. Any of these phases can be configured to be skipped, but at least one of the instruction, address, alternate byte, or data phase must be present.

NCS falls before the start of each command and rises again after each command finishes.

Figure 60. Example of read command in quad-SPI mode

#### Instruction phase

During this phase, an 8-bit instruction, configured in INSTRUCTION bitfield of QUADSPI\_CCR[7:0] register, is sent to the flash memory, specifying the type of operation to be performed.

Most flash memories can receive instructions only one bit at a time from the IO0/SO signal (single-SPI mode), the instruction phase can optionally send 2 bits at a time (over IO0/IO1 in dual-SPI mode), or 4 bits at a time (over IO0/IO1/IO2/IO3 in quad-SPI mode). This can be configured using the IMODE[1:0] bitfield of QUADSPI\_CCR[9:8] register.

When IMODE = 00, the instruction phase is skipped, and the command sequence starts with the address phase, if present.

### Address phase

In the address phase, 1-4 bytes are sent to the flash memory to indicate the address of the operation. The number of address bytes to be sent is configured in the `ADSIZE[1:0]` bitfield of `QUADSPI_CCR[13:12]` register. In indirect and automatic status-polling modes, address bytes to be sent are specified in the `ADDRESS[31:0]` bitfield of `QUADSPI_AR` register, while in memory-mapped mode, the address is given directly via the AHB (from the Cortex or from a DMA).

The address phase can send 1 bit at a time (over `SO` in single-SPI mode), 2 bits at a time (over `IO0/IO1` in dual-SPI mode), or 4 bits at a time (over `IO0/IO1/IO2/IO3` in quad-SPI mode). This can be configured using the `ADMODE[1:0]` bitfield of `QUADSPI_CCR[11:10]` register.

When `ADMODE = 00`, the address phase is skipped, and the command sequence proceeds directly to the next phase, if any.

### Alternate-byte phase

In the alternate-byte phase, 1-4 bytes are sent to the flash memory, generally to control the mode of operation. The number of alternate bytes to be sent is configured in the `[1:0]` bitfield of `QUADSPI_CCR[17:16]` register. The bytes to be sent are specified in the `QUADSPI_ABR` register.

The alternate-bytes phase can send 1 bit at a time (over `SO` in single-SPI mode), 2 bits at a time (over `IO0/IO1` in dual-SPI mode), or 4 bits at a time (over `IO0/IO1/IO2/IO3` in quad-SPI mode). This can be configured using the `ABMODE[1:0]` bitfield of `QUADSPI_CCR[15:14]` register.

When `ABMODE = 00`, the alternate-byte phase is skipped, and the command sequence proceeds directly to the next phase, if any.

There may be times when only a single nibble needs to be sent during the alternate-byte phase rather than a full byte, such as when the dual-mode is used and only two cycles are used for the alternate bytes. In this case, the firmware can use quad-mode (`ABMODE = 11`) and send a byte with bits 7 and 3 of `ALTERNATE` set to 1 (keeping the `IO3` line high), and bits 6 and 2 set to 0 (keeping the `IO2` line low). In this case, the upper two bits of the nibble to be sent are placed in bits 4:3 of `ALTERNATE`, while the lower two bits are placed in bits 1 and 0. For example, if the nibble 2 (0010) is to be sent over `IO0/IO1`, then `ALTERNATE` must be set to 0x8A (1000\_1010).

### Dummy-cycle phase

In the dummy-cycle phase, 1-31 cycles are given without any data being sent or received, in order to give time to the flash memory to prepare for the data phase when higher clock frequencies are used. The number of cycles given during this phase is specified in the `DCYC[4:0]` bitfield of `QUADSPI_CCR[22:18]` register. In both SDR and DDR modes, the duration is specified as a number of full `CLK` cycles.

When `DCYC` is zero, the dummy-cycles phase is skipped, and the command sequence proceeds directly to the data phase, if present.

The operating mode of the dummy-cycles phase is determined by `DMODE`.

In order to assure enough “turn-around” time for changing data signals from output mode to input mode, there must be at least one dummy cycle when using dual or quad mode to receive data from the flash memory.

### Data phase

During the data phase, any number of bytes can be sent to, or received from the flash memory.

In indirect and automatic status-polling modes, the number of bytes to be sent/received is specified in the QUADSPI\_DLR register.

In indirect-write mode the data to be sent to the flash memory must be written to the QUADSPI\_DR register. In indirect-read mode the data received from the flash memory is obtained by reading the QUADSPI\_DR register.

In memory-mapped mode, the data which is read is sent back directly over the AHB to the Cortex or to a DMA.

The data phase can send/receive 1 bit at a time (over SO/SI in single-SPI mode), 2 bits at a time (over IO0/IO1 in dual-SPI mode), or 4 bits at a time (over IO0/IO1/IO2/IO3 in quad-SPI mode). This can be configured using the ABMODE[1:0] bitfield of QUADSPI\_CCR[15:14] register.

When DMODE = 00, the data phase is skipped, and the command sequence finishes immediately by raising NCS. This configuration must only be used in only indirect write mode.

## 17.4.4 QUADSPI signal interface protocol modes

### Single-SPI mode

This legacy SPI mode allows just one single bit to be sent/received serially. In this mode, data are sent to the flash memory over the SO signal (whose I/O shared with IO0). Data received from the flash memory arrive via SI (whose I/O shared with IO1).

The different phases can each be configured separately to use this mode by setting the IMODE/ADMODE/ABMODE/DMODE fields (in QUADSPI\_CCR) to 01.

In each phase which is configured in single-SPI mode:

- IO0 (SO) is in output mode.
- IO1 (SI) is in input mode (high impedance).
- IO2 is in output mode and forced to 0.
- IO3 is in output mode and forced to 1 (to deactivate the “hold” function).

This is the case even for the dummy phase if DMODE = 01.

### Dual-SPI mode

In dual-SPI mode, two bits are sent/received simultaneously over the IO0/IO1 signals.

The different phases can each be configured separately to use dual-SPI mode by setting the IMODE/ADMODE/ABMODE/DMODE fields of QUADSPI\_CCR register to 10.

In each phase which is configured in dual-SPI mode:

- IO0/IO1 are at high-impedance (input) during the data phase for read operations, and outputs in all other cases.
- IO2 is in output mode and forced to 0.
- IO3 is in output mode and forced to 1.

In the dummy phase when DMODE = 01, IO0/IO1 are always high-impedance.

### Quad-SPI mode

In quad-SPI mode, four bits are sent/received simultaneously over the IO0/IO1/IO2/IO3 signals.

The different phases can each be configured separately to use quad-SPI mode by setting the IMODE/ADMODE/ABMODE/DMODE fields of QUADSPI\_CCR register to 11.

In each phase which is configured in this mode, IO0/IO1/IO2/IO3 are all at high-impedance (input) during the data phase for read operations, and outputs in all other cases.

In the dummy phase when DMODE = 11, IO0/IO1/IO2/IO3 are all high-impedance.

IO2 and IO3 are used only in quad-SPI mode. If none of the phases are configured to use quad-SPI mode, then the pins corresponding to IO2 and IO3 can be used for other functions even while the QUADSPI is active.

### SDR mode

By default, the DDRM bit (QUADSPI\_CCR[31]) is 0 and the QUADSPI operates in single-data rate (SDR) mode.

In SDR mode, when the QUADSPI drives IO0/SO, IO1, IO2, IO3 signals, these signals transition only with the falling edge of CLK.

When receiving data in SDR mode, the QUADSPI assumes that flash memories also send the data using CLK falling edge. By default (when SSHIFT = 0), the signals are sampled using the following (rising) edge of CLK.

### DDR mode

When the DDRM bit (QUADSPI\_CCR[31]) is set to 1, the QUADSPI operates in double-data rate (DDR) mode.

In DDR mode, when the QUADSPI is driving the IO0/SO, IO1, IO2, IO3 signals in the address/alternate-byte/data phases, a bit is sent on each of CLK falling and rising edges.

The instruction phase is not affected by DDRM. The instruction is always sent using CLK falling edge.

When receiving data in DDR mode, the QUADSPI assumes that flash memories also send the data using both CLK rising and falling edges. When DDRM = 1, the firmware must clear SSHIFT (bit 4 of QUADSPI\_CR). Thus, the signals are sampled one half of a CLK cycle later (on the following, opposite edge).

Figure 61. Example of a DDR command in quad-SPI mode

### Dual-flash mode

When the DFM bit (bit 6 of QUADSPI\_CR) is 1, the QUADSPI is in dual-flash mode, where two external quad-SPI flash memories (FLASH 1 and FLASH 2) are used in order to send/receive 8 bits (or 16 bits in DDR mode) every cycle, effectively doubling the throughput as well as the capacity.

Each of the flash memories uses the same CLK and optionally the same NCS signals, but each have separate IO0, IO1, IO2, and IO3 signals.

The dual-flash mode can be used in conjunction with single-, dual-, and quad-SPI modes, as well as with either SDR or DDR mode.

The flash memory size, as specified in FSIZE[4:0] (QUADSPI\_DCR[20:16]), must reflect the total flash memory capacity, which is double the size of one individual component.

If address X is even, then the byte which the QUADSPI gives for address X is the byte at the address X/2 of FLASH 1, and the byte which the QUADSPI gives for address X+1 is the byte at the address X/2 of FLASH 2. In other words, bytes at even addresses are all stored in FLASH 1 and bytes at odd addresses are all stored in FLASH 2.

When reading the flash memories status registers in dual-flash mode, twice as many bytes must be read compared to doing the same read in single-flash mode. This means that if each flash memory gives 8 valid bits after the instruction for fetching the status register, then the QUADSPI must be configured with a data length of 2 bytes (16 bits), and the QUADSPI receives one byte from each flash memory. If each flash memory gives a status of 16 bits, then the QUADSPI must be configured to read 4 bytes to get all the status bits of both flash memories in dual-flash mode. The least-significant byte of the result (in the data register) is the least-significant byte of FLASH 1 status register, while the next byte is the least-significant byte of FLASH 2 status register. Then, the third byte of the data register is FLASH 1 second byte, while the forth byte is FLASH 2 second byte (in the case that the flash memories have 16-bit status registers).

An even number of bytes must always be accessed in dual-flash mode. For this reason, bit 0 of the data length bitfield (QUADSPI\_DLR[0]) is stuck at 1 when DFM = 1.

In dual-flash mode, the behavior of FLASH 1 interface signals are basically the same as in normal mode. FLASH 2 interface signals have exactly the same waveforms as FLASH 1 during the instruction, address, alternate-byte, and dummy-cycles phases. In other words, each flash memory always receives the same instruction and the same address. Then, during the data phase, the BK1\_IOx and BK2\_IOx buses are both transferring data in

parallel, but the data that are sent to (or received from) FLASH 1 are distinct from those of FLASH 2.

### 17.4.5 QUADSPI indirect mode

When in indirect mode, commands are started by writing to QUADSPI registers, and data are transferred by writing or reading the data register, in the same way as for other communication peripherals.

When FMODE = 00 (QUADSPI\_CCR[27:26]), the QUADSPI is in indirect-write mode, where bytes are sent to the flash memory during the data phase. Data are provided by writing to the data register (QUADSPI\_DR).

When FMODE = 01, the QUADSPI is in indirect-read mode, where bytes are received from the flash memory during the data phase. Data are recovered by reading QUADSPI\_DR.

The number of bytes to be read/written is specified in the data length register (QUADSPI\_DLR). If QUADSPI\_DLR = 0xFFFF\_FFFF (all 1s), then the data length is considered undefined and the QUADSPI simply continues to transfer data until the end of flash memory (as defined by FSIZE) is reached. If no bytes are to be transferred, DMODE (QUADSPI\_CCR[25:24]) must be set to 00.

If QUADSPI\_DLR = 0xFFFF\_FFFF and FSIZE = 0x1F (max value indicating a 4-Gbyte flash memory), then in this special case, transfers continue indefinitely, stopping only after an abort request or after the QUADSPI is disabled. After the last memory address is read (at address 0xFFFF\_FFFF), reading continues with address = 0x0000\_0000.

When the programmed number of bytes to be transmitted or received is reached, TCF is set and an interrupt is generated if TCIE = 1. In the case of undefined number of data, the TCF is set when the limit of the external SPI memory is reached according to the flash memory size defined in QUADSPI\_CR.

#### Triggering the start of a command

Essentially, a command starts as soon as firmware gives the last information that is necessary for this command. Depending on the QUADSPI configuration, there are three different ways to trigger the start of a command in indirect mode. The commands start immediately:

- after a write is performed to INSTRUCTION[7:0] (QUADSPI\_CCR), if no address is necessary (when ADMODE = 00) and if no data needs to be provided by the firmware (when FMODE = 01 or DMODE = 00)
- after a write is performed to ADDRESS[31:0] (QUADSPI\_AR), if an address is necessary (when ADMODE ≠ 00) and if no data needs to be provided by the firmware (when FMODE = 01 or DMODE = 00)
- after a write is performed to DATA[31:0] (QUADSPI\_DR), if data needs to be provided by the firmware (when FMODE = 00 and DMODE ≠ 00)

Writes to the alternate byte register (QUADSPI\_ABR) never trigger the communication start. If alternate bytes are required, they must be programmed before.

As soon as a command is started, BUSY (bit 5 of QUADSPI\_SR) is automatically set.

### FIFO and data management

In indirect mode, data go through a 16-byte FIFO which is internal to the QUADSPI. FLEVEL[4:0] (QUADSPI\_SR[12:8]) indicates how many bytes are currently being held in the FIFO.

In indirect-write mode (FMODE = 00), the firmware adds data to the FIFO when it writes QUADSPI\_DR. Word writes add 4 bytes to the FIFO, halfword writes add 2 bytes, and byte writes add only 1 byte. If the firmware adds too many bytes to the FIFO (more than is indicated by DL[31:0]), the extra bytes are flushed from the FIFO at the end of the write operation (when TCF is set).

Byte/halfword accesses to QUADSPI\_DR must be done only to the least significant byte/halfword of the 32-bit register.

FTHRES[3:0] is used to define a FIFO threshold. When the threshold is reached, FTF (FIFO threshold flag) is set. In indirect-read mode, FTF is set when the number of valid bytes to be read from the FIFO is above the threshold. FTF is also set if there are data in the FIFO after the last byte is read from the flash memory, regardless of the FTHRES setting. In indirect-write mode, FTF is set when the number of empty bytes in the FIFO is above the threshold.

If FTIE = 1, there is an interrupt when FTF is set. If DMAEN = 1, a DMA transfer is initiated when FTF is set. FTF is cleared by hardware as soon as the threshold condition is no longer true (after enough data is transferred by the CPU or DMA).

In indirect-read mode when the FIFO becomes full, the QUADSPI temporarily stops reading bytes from the flash memory to avoid an overrun. The reading of the flash memory does not restart until 4 bytes become vacant in the FIFO (when FLEVEL ≤ 11). Thus, when FTHRES ≥ 13, the application must take care to read enough bytes to assure that the QUADSPI starts retrieving data from the flash memory again. Otherwise, the FTF flag stays at 0 as long as 11 < FLEVEL < FTHRES.

### 17.4.6 QUADSPI automatic status-polling mode

In automatic status-polling mode, the QUADSPI periodically starts a command to read a defined number of status bytes (up to 4). The received bytes can be masked to isolate some status bits and an interrupt can be generated when the selected bits have a defined value.

Accesses to the flash memory begin in the same way as in indirect-read mode: if no address is required (AMODE = 00), accesses begin as soon as the QUADSPI\_CCR is written. Otherwise, if an address is required, the first access begins when QUADSPI\_AR is written. BUSY goes high at this point and stays high even between the periodic accesses.

The contents of MASK[31:0] (QUADSPI\_PSMAR) are used to mask the data from the flash memory in automatic status-polling mode. If MASK[n] = 0, then bit n of the result is masked and not considered. If MASK[n] = 1, and the content of bit[n] is the same as MATCH[n] (QUADSPI\_PSMAR), then there is a match for bit n.

If the polling match mode bit (PMM, bit 23 of QUADSPI\_CR) is 0, then “AND” match mode is activated. This means status match flag (SMF) is set only when there is a match on all of the unmasked bits.

If PMM = 1, then “OR” match mode is activated. This means SMF is set if there is a match on any of the unmasked bits.

An interrupt is called when SMF is set if SMIE = 1.

If the automatic status-polling mode stop (APMS) bit is set, the operation stops and BUSY goes to 0 as soon as a match is detected. Otherwise, BUSY stays at 1, and the periodic accesses continue until there is an abort or the QUADSPI is disabled (EN = 0).

The data register (QUADSPI\_DR) contains the latest received status bytes (the FIFO is deactivated). The content of the data register is not affected by the masking used in the matching logic. The FTF status bit is set as soon as a new reading of the status is complete, and FTF is cleared as soon as the data is read.

### 17.4.7 QUADSPI memory-mapped mode

When configured in memory-mapped mode, the external SPI device is seen as an internal memory.

It is forbidden to access the quad-SPI flash bank area before having properly configured and enabled the QUADSPI peripheral.

No more than 256 Mbytes can be addressed even if the flash memory capacity is larger.

If an access is made to an address outside of the range defined by FSIZE but still within the 256-Mbyte range, then a bus error is given. The effect of this error depends on the bus master that attempted the access:

- If it is the Cortex CPU, bus fault exception is generated when enabled (or an HardFault exception when bus fault is disabled).
- If it is a DMA, a DMA transfer error is generated and the corresponding DMA channel is automatically disabled.

Byte, halfword, and word access types are all supported.

Support for execute in place (XIP) operation is implemented, where the QUADSPI anticipates the next access and loads in advance the byte at the following address. If the subsequent access is indeed made at a continuous address, the access is completed faster since the value is already prefetched.

By default, the QUADSPI never stops its prefetch operation, keeping the previous read operation active with NCS maintained low, even if no access to the flash memory occurs for a long time. Since flash memories tend to consume more when NCS is held low, the application may want to activate the timeout counter (TCEN = 1, bit 3 of QUADSPI\_CR) so that NCS is released after a period of TIMEOUT[15:0] (QUADSPI\_LPTR) cycles have elapsed without any access since when the FIFO becomes full with prefetch data.

BUSY goes high as soon as the first memory-mapped access occurs. Because of the prefetch operations, BUSY does not fall until there is a timeout, there is an abort, or the peripheral is disabled.

### 17.4.8 QUADSPI flash memory configuration

The device configuration register (QUADSPI\_DCR) can be used to specify the characteristics of the external SPI flash memory.

The FSIZE[4:0] bitfield defines the size of external memory using the following formula:

$$\text{Number of bytes in flash memory} = 2^{[\text{FSIZE}+1]}$$

FSIZE+1 is effectively the number of address bits required to address the flash memory. The flash memory capacity can be up to 4 Gbytes (addressed using 32 bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256 Mbytes.

If DFM = 1, FSIZE indicates the total capacity of the two flash memories together.

When the QUADSPI executes two commands, one immediately after the other, it raises NCS high between the two commands for only one CLK cycle by default. If the flash memory requires more time between commands, the CSHT bitfield can be used to specify the minimum number of CLK cycles (up to 8) that NCS must remain high.

The clock mode (CKMODE) bit indicates the CLK signal logic level in between commands (when NCS = 1).

#### 17.4.9 QUADSPI delayed data sampling

By default, the QUADSPI samples the data driven by the flash memory one half of a CLK cycle after the flash memory drives the signal.

In case of external signal delays, it may be beneficial to sample the data later. Using SSHIFT (bit 4 of QUADSPI\_CR), the sampling of the data can be shifted by half of a CLK cycle.

Clock shifting is not supported in DDR mode: SSHIFT must be clear when DDRM bit is set.

#### 17.4.10 QUADSPI configuration

The QUADSPI configuration is done in two phases:

1. QUADSPI peripheral configuration
2. QUADSPI flash memory configuration

Once configured and enabled, the QUADSPI can be used in one of its three operating modes: indirect, automatic status-polling, or memory-mapped mode.

##### QUADSPI configuration

The QUADSPI is configured using QUADSPI\_CR. The user must configure the clock prescaler division factor and the sample shifting settings for the incoming data.

The DDR mode can be set through the DDRM bit. When setting the quad-SPI interface in DDR mode, the internal divider of kernel clock must be set with a division ratio of two or more. Once enabled, the address and the alternate bytes are sent on both clock edges, and the data are sent/received on both clock edges. Regardless of the DDRM bit setting, instructions are always sent in SDR mode.

DMA requests are enabled setting the DMAEN bit. In case of interrupt usage, their respective enable bit can be also set during this phase.

The FIFO level for either DMA request generation or interrupt generation is programmed in the FTHRES bits.

If a timeout counter is needed, the TCEN bit can be set and the timeout value programmed in the QUADSPI\_LPTR register.

The dual-flash mode can be activated by setting DFM to 1.

##### QUADSPI flash memory configuration

The parameters related to the targeted external flash memory are configured through the QUADSPI\_DCR register. The user must program the flash memory size in the FSIZE bits, the chip-select minimum high time in CSHT bits, and the functional mode (Mode 0 or Mode 3) in the MODE bit.

### 17.4.11 QUADSPI use

The operating mode is selected using FMODE[1:0] (QUADSPI\_CCR[27:26]).

#### Indirect mode

When FMODE is programmed to 00, the indirect-write mode is selected and data can be sent to the flash memory. With FMODE = 01, the indirect-read mode is selected where data can be read from the flash memory.

When the QUADSPI is used in indirect mode, the frames are constructed in the following way:

1. Specify a number of data bytes to read or write in QUADSPI\_DLR.
2. Specify the frame format, mode and instruction code in QUADSPI\_CCR.
3. Specify optional alternate byte to be sent right after the address phase in QUADSPI\_ABR.
4. Specify the operating mode in QUADSPI\_CR. If FMODE = 00 (indirect-write mode) and DMAEN = 1, then QUADSPI\_AR must be specified before QUADSPI\_CR. Otherwise QUADSPI\_DR can be written by the DMA before QUADSPI\_AR is updated (if the DMA controller has already been enabled).
5. Specify the targeted address in QUADSPI\_AR.
6. Read/write the data from/to the FIFO through QUADSPI\_DR.

When writing QUADSPI\_CR, the user specifies the following settings:

- enable bit (EN) set to 1
- DMA enable bit (DMAEN) for transferring data to/from RAM
- timeout counter enable bit (TCEN)
- sample shift setting (SSHIFT)
- FIFO threshold level (FTRHES) to indicate when the FTF flag must be set
- interrupt enables
- automatic status-polling mode parameters: match mode and stop mode (valid when FMODE = 11)
- clock prescaler

When writing QUADSPI\_CCR, the user specifies the following parameters:

- instruction byte through INSTRUCTION bits
- the way the instruction has to be sent through the IMODE bits (1/2/4 lines)
- the way the address has to be sent through the ADMODE bits (None/1/2/4 lines)
- address size (8/16/24/32-bit) through ADSIZE bits
- the way the alternate bytes have to be sent through the ABMODE (None/1/2/4 lines)
- alternate bytes number (1/2/3/4) through the ABSIZE bits
- presence or not of dummy bytes through the DBMODE bit
- number of dummy bytes through the DCYC bits
- the way data have to be sent/received (none/1/2/4 lines) through DMODE bits

If neither QUADSPI\_AR nor QUADSPI\_DR need to be updated for a particular command, then the command sequence starts as soon as QUADSPI\_CCR is written. This is the case when both ADMODE and DMODE are 00, or if just ADMODE = 00 when in indirect read mode (FMODE = 01).

When an address is required (ADMODE is not 00) and the data register does not need to be written (when FMODE = 01 or DMODE = 00), the command sequence starts as soon as the address is updated with a write to QUADSPI\_AR.

In case of data transmission (FMODE = 00 and DMODE = 00), the communication start is triggered by a write in the FIFO through QUADSPI\_DR.

### Automatic status-polling mode

This mode is enabled setting the FMODE bitfield (QUADSPI\_CCR[27:26]) to 10. In this mode, the programmed frame is sent and the data retrieved periodically.

The maximum amount of data read in each frame is 4 bytes. If more data is requested in QUADSPI\_DLR, it is ignored and only 4 bytes are read.

The periodicity is specified in the QUADSPI\_PISR register.

Once the status data is retrieved, it can internally be processed:

- to set the status match flag and generate an interrupt if enabled
- to stop automatically the periodic retrieving of the status bytes

The received value can be masked with the value stored in QUADSPI\_PSMKR and ORed or ANDed with the value stored in QUADSPI\_PSMAR.

In case of match, the status match flag is set and an interrupt is generated if enabled, and the QUADSPI can be automatically stopped if the AMPS bit is set.

In any case, the latest retrieved value is available in QUADSPI\_DR.

### Memory-mapped mode

In memory-mapped mode, the external flash memory is seen as an internal memory but with some latency during accesses. Only read operations are allowed to the external flash memory in this mode.

The memory-mapped mode is entered by setting FMODE to 11 in QUADSPI\_CCR.

The programmed instruction and frame is sent when a master is accessing the memory-mapped space.

The FIFO is used as a prefetch buffer to anticipate linear reads. Any access to QUADSPI\_DR in this mode returns zero.

QUADSPI\_DLR has no meaning in memory-mapped mode.

## 17.4.12 Sending the instruction only once

Some flash memories (for example: Winbound) provide a mode where an instruction must be sent only with the first command sequence, while subsequent commands start directly with the address. One can take advantage of such a feature using the SIOO bit (QUADSPI\_CCR[28]).

SIOO is valid for all functional modes (indirect, automatic status-polling, and memory-mapped). If the SIOO bit is set, the instruction is sent only for the first command following a write to QUADSPI\_CCR. Subsequent command sequences skip the instruction phase, until there is a write to QUADSPI\_CCR.

SIOO has no effect when IMODE = 00 (no instruction).

### 17.4.13 QUADSPI error management

An error can be generated in the following case:

- In indirect mode or automatic status-polling mode when a wrong address is programmed in QUADSPI\_AR (according to the flash memory size defined by FSIZE[4:0] in the QUADSPI\_DCR), TEF is set and an interrupt is generated if enabled. Also in indirect mode, if the address plus the data length exceeds the flash memory size, TEF is set as soon as the access is triggered.
- In memory-mapped mode, when an out-of-range access is done by a master or when the QUADSPI is disabled, a bus error is generated as a response to the faulty bus master request.

When a master is accessing the memory mapped space while the memory-mapped mode is disabled, a bus error is generated as a response to the faulty bus master request.

### 17.4.14 QUADSPI busy bit and abort functionality

Once the QUADSPI starts an operation with the flash memory, the BUSY bit is automatically set in QUADSPI\_SR.

In indirect mode, BUSY is reset once the QUADSPI has completed the requested command sequence, and the FIFO is empty.

In automatic status-polling mode, BUSY goes low only after the last periodic access is complete, due to a match when APMS = 1, or due to an abort.

After the first access in memory-mapped mode, BUSY goes low only on a timeout event or on an abort.

Any operation can be aborted by setting the ABORT bit in QUADSPI\_CR. Once the abort is completed, BUSY and ABORT are automatically reset, and the FIFO is flushed.

*Note: Some flash memories may misbehave if a write operation to a status registers is aborted.*

### 17.4.15 NCS behavior

By default, NCS is high, deselecting the external flash memory. NCS falls before an operation begins and rises as soon as it finishes.

When CKMODE = 0 ("mode0", where CLK stays low when no operation is in progress), NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final rising CLK edge, as shown in the figure below.

**Figure 62. NCS when CKMODE = 0 (T = CLK period)**

When CKMODE=1 (“mode3”, where CLK goes high when no operation is in progress) and DDRM=0 (SDR mode), NCS still falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final rising CLK edge, as shown in the figure below.

**Figure 63. NCS when CKMODE = 1 in SDR mode ( $T = \text{CLK period}$ )**

When CKMODE = 1 (“mode3”) and DDRM = 1 (DDR mode), NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final active rising CLK edge, as shown in the figure below. Because DDR operations must finish with a falling edge, CLK is low when NCS rises, and CLK rises back up one half of a CLK cycle afterwards.

**Figure 64. NCS when CKMODE = 1 in DDR mode ( $T = \text{CLK period}$ )**

When the FIFO stays full in a read operation or if the FIFO stays empty in a write operation, the operation stalls and CLK stays low until firmware services the FIFO. If an abort occurs when an operation is stalled, NCS rises just after the abort is requested and then CLK rises one half of a CLK cycle later, as shown in [Figure 65](#).

**Figure 65. NCS when CKMODE = 1 with an abort (T = CLK period)**

When not in dual-flash mode (DFM = 0) and FSEL = 0 (default value), only FLASH 1 is accessed. Thus BK2\_NCS stays high, if FSEL = 1, only FLASH 2 is accessed and BK1\_NCS stays high. In dual-flash mode, BK2\_NCS behaves exactly the same as BK1\_NCS. Thus, if there is a FLASH 2 and if the application is dual-flash mode only, then BK1\_NCS signal can be used for FLASH 2 as well, and the pin devoted to BK2\_NCS can be used for other functions.

## 17.5 QUADSPI interrupts

An interrupt can be produced on the following events:

- Timeout
- Status match
- FIFO threshold
- Transfer complete
- Transfer error

Separate interrupt enable bits are available for flexibility.

**Table 101. QUADSPI interrupt requests**

| Interrupt event   | Event flag | Enable control bit |
|-------------------|------------|--------------------|
| Timeout           | TOF        | TOIE               |
| Status match      | SMF        | SMIE               |
| FIFO threshold    | FTF        | FTIE               |
| Transfer complete | TCF        | TCIE               |
| Transfer error    | TEF        | TEIE               |

## 17.6 QUADSPI registers

### 17.6.1 QUADSPI control register (QUADSPI\_CR)

Address offset: 0x000

Reset value: 0x0000 0000

|                |      |      |      |             |    |    |    |      |      |      |        |      |       |       |      |
|----------------|------|------|------|-------------|----|----|----|------|------|------|--------|------|-------|-------|------|
| 31             | 30   | 29   | 28   | 27          | 26 | 25 | 24 | 23   | 22   | 21   | 20     | 19   | 18    | 17    | 16   |
| PRESCALER[7:0] |      |      |      |             |    |    |    | PMM  | APMS | Res. | TOIE   | SMIE | FTIE  | TCIE  | TEIE |
| rw             | rw   | rw   | rw   | rw          | rw | rw | rw | rw   | rw   |      | rw     | rw   | rw    | rw    | rw   |
| 15             | 14   | 13   | 12   | 11          | 10 | 9  | 8  | 7    | 6    | 5    | 4      | 3    | 2     | 1     | 0    |
| Res.           | Res. | Res. | Res. | FTHRES[3:0] |    |    |    | FSEL | DFM  | Res. | SSHIFT | TCEN | DMAEN | ABORT | EN   |
|                |      |      |      | rw          | rw | rw | rw | rw   | rw   |      | rw     | rw   | rw    | rw    | rw   |

Bits 31:24 **PRESCALER[7:0]**: Clock prescaler

This bitfield defines the scaler factor for generating CLK based on the AHB clock (value+1).

0:  $F_{CLK} = F_{AHB}$ , AHB clock used directly as QUADSPI CLK (prescaler bypassed)

1:  $F_{CLK} = F_{AHB}/2$

2:  $F_{CLK} = F_{AHB}/3$

...

255:  $F_{CLK} = F_{AHB}/256$

For odd clock division factors, CLK duty cycle is not 50%. The clock signal remains low one cycle longer than it stays high.

When setting quad-SPI interface in DDR mode, the prescaler must be set with a division ratio of two or more.

*Note: This bitfield can be modified only when  $BUSY = 0$ .*

Bit 23 **PMM**: Polling match mode

This bit indicates which method must be used for determining a “match” during automatic status-polling mode.

0: AND match mode. SMF is set if all the unmasked bits received from the flash memory match the corresponding bits in the match register.

1: OR match mode. SMF is set if any one of the unmasked bits received from the flash memory matches its corresponding bit in the match register.

*Note: This bit can be modified only when  $BUSY = 0$ .*

Bit 22 **APMS**: Automatic status-polling mode stop

This bit determines if automatic status-polling is stopped after a match.

0: Automatic status-polling mode is stopped only by abort or by disabling the QUADSPI.

1: Automatic status-polling mode stops as soon as there is a match.

*Note: This bit can be modified only when  $BUSY = 0$ .*

Bit 21 Reserved, must be kept at reset value.

Bit 20 **TOIE**: Timeout interrupt enable

This bit enables the timeout interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 19 **SMIE**: Status match interrupt enable  
 This bit enables the status match interrupt.  
 0: Interrupt disabled  
 1: Interrupt enabled

Bit 18 **FTIE**: FIFO threshold interrupt enable  
 This bit enables the FIFO threshold interrupt.  
 0: Interrupt disabled  
 1: Interrupt enabled

Bit 17 **TCIE**: Transfer complete interrupt enable  
 This bit enables the transfer complete interrupt.  
 0: Interrupt disabled  
 1: Interrupt enabled

Bit 16 **TEIE**: Transfer error interrupt enable  
 This bit enables the transfer error interrupt.  
 0: Interrupt disabled  
 1: Interrupt enabled

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **FTHRES[3:0]**: FIFO threshold level  
 This bitfield defines, in indirect mode, the threshold number of bytes in the FIFO that causes the FIFO threshold flag (bit FTF in register QUADSPI\_SR) to be set.  
 0: In indirect-write mode (FMODE = 00), FTF is set if there are one or more free bytes location left in the FIFO, or indirect-read mode (FMODE = 01), FTF is set if there are 1 or more valid bytes that can be read from the FIFO.  
 1: In indirect-write mode (FMODE = 00), FTF is set if there are two or more free bytes location left in the FIFO, or indirect read mode (FMODE = 01), FTF is set if there are two or more valid bytes that can be read from the FIFO.  
 ...  
 15: In indirect-write mode (FMODE = 00), FTF is set if there are 16 free bytes location left in the FIFO, or indirect read mode (FMODE = 01), FTF is set if there are 16 valid bytes that can be read from the FIFO.  
 If DMAEN = 1, then the DMA controller for the corresponding channel must be disabled before changing the FTHRES value.

Bit 7 **FSEL**: Flash memory selection  
 This bit selects the flash memory to be addressed in single-flash mode (when DFM = 0).  
 0: FLASH 1 selected  
 1: FLASH 2 selected

*Note: This bit can be modified only when BUSY = 0. This bit is ignored when DFM = 1.*

Bit 6 **DFM**: Dual-flash mode  
 This bit activates dual-flash mode, where two external flash memories are used simultaneously to double throughput and capacity.  
 0: Dual-flash mode disabled  
 1: Dual-flash mode enabled

*Note: This bit can be modified only when BUSY = 0.*

Bit 5 Reserved, must be kept at reset value.

**Bit 4 SSHIFT:** Sample shift

By default, the QUADSPI samples data 1/2 of a CLK cycle after the data is driven by the flash memory. This bit allows the data to be sampled later in order to account for external signal delays.

0: No shift

1: 1/2 cycle shift

The firmware must assure that SSHIFT = 0 when in DDR mode (when DDRM = 1).

*Note: This bitfield can be modified only when BUSY = 0.*

**Bit 3 TCEN:** Timeout counter enable

This bit is valid only when memory-mapped mode (FMODE = 11) is selected. Activating this bit causes the NCS to be released (and thus reduces consumption) if there has not been an access after a certain amount of time, where this time is defined by TIMEOUT[15:0] (QUADSPI\_LPTR). This bit enables the timeout counter.

By default, the QUADSPI never stops its prefetch operation, keeping the previous read operation active with NCS maintained low, even if no access to the flash memory occurs for a long time. Since flash memories tend to consume more when NCS is held low, the application may want to activate the timeout counter (TCEN = 1, bit 3 of QUADSPI\_CR) so that NCS is released after a period of TIMEOUT[15:0] (QUADSPI\_LPTR) cycles have elapsed without an access since when the FIFO becomes full with prefetch data.

0: Timeout counter is disabled, and thus the NCS remains active indefinitely after an access in memory-mapped mode.

1: Timeout counter is enabled, and thus the NCS is released in memory-mapped mode after TIMEOUT[15:0] cycles of flash memory inactivity.

*Note: This bit can be modified only when BUSY = 0.*

**Bit 2 DMAEN:** DMA enable

In indirect mode, the DMA can be used to input or output data via the QUADSPI\_DR register. DMA transfers are initiated when the FIFO threshold flag, FTF, is set.

0: DMA is disabled for indirect mode.

1: DMA is enabled for indirect mode.

**Bit 1 ABORT:** Abort request

This bit aborts the ongoing command sequence. It is automatically reset once the abort is complete. This bit stops the current transfer.

In automatic status-polling or memory-mapped mode, this bit also reset APM or DM bit.

0: No abort requested

1: Abort requested

**Bit 0 EN:** QUADSPI enable

0: QUADSPI disabled

1: QUADSPI enabled

## 17.6.2 QUADSPI device configuration register (QUADSPI\_DCR)

Address offset: 0x004

Reset value: 0x0000 0000

|      |      |      |      |      |           |      |      |      |      |      |            |      |      |      |        |
|------|------|------|------|------|-----------|------|------|------|------|------|------------|------|------|------|--------|
| 31   | 30   | 29   | 28   | 27   | 26        | 25   | 24   | 23   | 22   | 21   | 20         | 19   | 18   | 17   | 16     |
| Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. | Res. | Res. | FSIZE[4:0] |      |      |      |        |
|      |      |      |      |      |           |      |      |      |      |      | rw         | rw   | rw   | rw   | rw     |
| 15   | 14   | 13   | 12   | 11   | 10        | 9    | 8    | 7    | 6    | 5    | 4          | 3    | 2    | 1    | 0      |
| Res. | Res. | Res. | Res. | Res. | CSHT[2:0] |      |      | Res. | Res. | Res. | Res.       | Res. | Res. | Res. | CKMODE |
|      |      |      |      |      | rw        | rw   | rw   |      |      |      |            |      |      |      | rw     |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **FSIZE[4:0]**: Flash memory size

This bitfield defines the size of external memory using the following formula:

Number of bytes in flash memory =  $2^{[FSIZE+1]}$

FSIZE+1 is effectively the number of address bits required to address the flash memory.

The flash memory capacity can be up to 4 Gbytes (addressed using 32 bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256 Mbytes.

If DFM = 1, FSIZE indicates the total capacity of the two flash memories together.

*Note: This bitfield can be modified only when BUSY = 0.*

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:8 **CSHT[2:0]**: Chip select high time

CSHT+1 defines the minimum number of CLK cycles which the chip select (NCS) must remain high between commands issued to the flash memory.

0: NCS stays high for at least 1 cycle between flash memory commands

1: NCS stays high for at least 2 cycles between flash memory commands

...

7: NCS stays high for at least 8 cycles between flash memory commands

*Note: This bitfield can be modified only when BUSY = 0.*

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **CKMODE**: Mode 0/mode 3

This bit indicates the level that CLK takes between commands (when NCS = 1).

0: CLK must stay low while NCS is high (chip select released). This is referred to as mode 0.

1: CLK must stay high while NCS is high (chip select released). This is referred to as mode 3.

*Note: This bitfield can be modified only when BUSY = 0.*

### 17.6.3 QUADSPI status register (QUADSPI\_SR)

Address offset: 0x008

Reset value: 0x0000 0000

|      |      |      |             |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|-------------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28          | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |             |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12          | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | FLEVEL[4:0] |      |      |      |      | Res. | Res. | BUSY | TOF  | SMF  | FTF  | TCF  | TEF  |
|      |      |      | r           | r    | r    | r    | r    |      |      | r    | r    | r    | r    | r    | r    |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:8 **FLEVEL[4:0]**: FIFO level

This bitfield gives the number of valid bytes which are being held in the FIFO. FLEVEL = 0 when the FIFO is empty, and 16 when it is full. In memory-mapped mode and in automatic status-polling mode, FLEVEL is zero.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **BUSY**: Busy

This bit is set when an operation is on going. This bit clears automatically when the operation with the flash memory is finished and the FIFO is empty.

Bit 4 **TOF**: Timeout flag

This bit is set when timeout occurs. It is cleared by writing 1 to CTOF.

Bit 3 **SMF**: Status match flag

This bit is set in automatic status-polling mode when the unmasked received data matches the corresponding bits in the match register (QUADSPI\_PSMAR). It is cleared by writing 1 to CSMF.

Bit 2 **FTF**: FIFO threshold flag

In indirect mode, this bit is set when the FIFO threshold is reached, or if there is any data left in the FIFO after reads from the flash memory are complete. It is cleared automatically as soon as threshold condition is no longer true.

In automatic status-polling mode this bit is set every time the status register is read, and the bit is cleared when the data register is read.

Bit 1 **TCF**: Transfer complete flag

This bit is set in indirect mode when the programmed number of data is transferred or in any mode when the transfer is aborted. It is cleared by writing 1 to CTCF.

Bit 0 **TEF**: Transfer error flag

This bit is set in indirect mode when an invalid address is being accessed in indirect mode. It is cleared by writing 1 to CTEF.

### 17.6.4 QUADSPI flag clear register (QUADSPI\_FCR)

Address offset: 0x00C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CTOF | CSMF | Res. | CTCF | CTEF |
|      |      |      |      |      |      |      |      |      |      |      | w    | w    |      | w    | w    |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CTOF**: Clear timeout flag

Writing 1 clears the TOF flag in QUADSPI\_SR.

Bit 3 **CSMF**: Clear status match flag

Writing 1 clears the SMF flag in QUADSPI\_SR.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CTCF**: Clear transfer complete flag

Writing 1 clears the TCF flag in QUADSPI\_SR.

Bit 0 **CTEF**: Clear transfer error flag

Writing 1 clears the TEF flag in QUADSPI\_SR.

### 17.6.5 QUADSPI data length register (QUADSPI\_DLR)

Address offset: 0x010

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DL[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DL[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:0 **DL[31:0]**: Data length

Number of data to be retrieved (value+1) in indirect and automatic status-polling modes.  
A value no greater than 3 (indicating 4 bytes) must be used for automatic status-polling mode.

All 1s in indirect mode means undefined length, where the QUADSPI continues until the end of memory, as defined by FSIZE.

0x0000\_0000: 1 byte is to be transferred

0x0000\_0001: 2 bytes are to be transferred

0x0000\_0002: 3 bytes are to be transferred

0x0000\_0003: 4 bytes are to be transferred

...

0xFFFF\_FFFD: 4,294,967,294 (4G-2) bytes are to be transferred

0xFFFF\_FFFE: 4,294,967,295 (4G-1) bytes are to be transferred

0xFFFF\_FFFF: undefined length -- all bytes until the end of flash memory (as defined by FSIZE) are to be transferred. Continue reading indefinitely if FSIZE = 0x1F.

DL[0] is stuck at 1 in dual-flash mode (DFM = 1) even when 0 is written to this bit, thus assuring that each access transfers an even number of bytes.

This bitfield has no effect when in memory-mapped mode (FMODE = 10).

*Note: This bitfield can be written only when BUSY = 0.*

### 17.6.6 QUADSPI communication configuration register (QUADSPI\_CCR)

Address offset: 0x014

Reset value: 0x0000 0000

|             |      |             |      |             |    |            |    |                  |           |    |    |    |             |    |    |
|-------------|------|-------------|------|-------------|----|------------|----|------------------|-----------|----|----|----|-------------|----|----|
| 31          | 30   | 29          | 28   | 27          | 26 | 25         | 24 | 23               | 22        | 21 | 20 | 19 | 18          | 17 | 16 |
| DDRM        | DHHC | Res.        | SIOO | FMODE[1:0]  |    | DMODE[1:0] |    | Res.             | DCYC[4:0] |    |    |    | ABSIZE[1:0] |    |    |
| rw          | rw   |             | rw   | rw          | rw | rw         | rw |                  | rw        | rw | rw | rw | rw          | rw | rw |
| 15          | 14   | 13          | 12   | 11          | 10 | 9          | 8  | 7                | 6         | 5  | 4  | 3  | 2           | 1  | 0  |
| ABMODE[1:0] |      | ADSIZE[1:0] |      | ADMODE[1:0] |    | IMODE[1:0] |    | INSTRUCTION[7:0] |           |    |    |    |             |    |    |
| rw          | rw   | rw          | rw   | rw          | rw | rw         | rw | rw               | rw        | rw | rw | rw | rw          | rw | rw |

Bit 31 **DDRM**: Double data rate mode

This bit sets the DDR mode for the address, alternate byte and data phase:

0: DDR mode disabled

1: DDR mode enabled

*Note: This bit can be written only when BUSY = 0.*

Bit 30 **DHHC**: DDR hold

This bit delays the data output by 1/4 of the QUADSPI output clock cycle in DDR mode:

0: Data output delayed using analog delay

1: Data output delayed by 1/4 of a QUADSPI output clock cycle

This feature is only active in DDR mode.

*Note: This bit can be written only when BUSY = 0.*

*PRESCALER > 0 is mandatory when DHHC = 1.*

Bit 29 Reserved, must be kept at reset value.

Bit 28 **SIOO**: Send instruction only once mode

This bit has no effect when IMODE = 00. See [Section 17.4.12](#) for more details.

0: Instruction sent on every transaction

1: Instruction sent only for the first command

*Note: This bit can be written only when BUSY = 0.*

Bits 27:26 **FMODE[1:0]**: Functional mode

This bitfield defines the QUADSPI functional mode of operation.

00: Indirect-write mode

01: Indirect-read mode

10: Automatic status-polling mode

11: Memory-mapped mode

If DMAEN = 1 already, the DMA controller for the corresponding channel must be disabled before changing the FMODE value.

*Note: This bitfield can be written only when BUSY = 0.*

Bits 25:24 **DMODE[1:0]**: Data mode

This bitfield defines the data phase mode of operation:

00: No data

01: Data on a single line

10: Data on two lines

11: Data on four lines

This bitfield also determines the dummy phase mode of operation.

*Note: This bitfield can be written only when BUSY = 0.*

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **DCYC[4:0]**: Number of dummy cycles

This bitfield defines the duration of the dummy phase. In both SDR and DDR modes, it specifies a number of CLK cycles (0-31).

*Note: This bitfield can be written only when BUSY = 0.*

Bits 17:16 **ABSIZE[1:0]**: Alternate-byte size

This bit defines the size of alternate bytes.

00: 8-bit alternate byte

01: 16-bit alternate bytes

10: 24-bit alternate bytes

11: 32-bit alternate bytes

*Note: This bitfield can be written only when BUSY = 0.*

Bits 15:14 **ABMODE[1:0]**: Alternate byte mode

This bitfield defines the alternate-byte phase mode of operation.

00: No alternate bytes

01: Alternate bytes on a single line

10: Alternate bytes on two lines

11: Alternate bytes on four lines

*Note: This bitfield can be written only when BUSY = 0.*

Bits 13:12 **ADSIZE[1:0]**: Address size

This bit defines address size:

00: 8-bit address

01: 16-bit address

10: 24-bit address

11: 32-bit address

*Note: This bitfield can be written only when BUSY = 0.*

Bits 11:10 **ADMODE[1:0]**: Address mode

This bitfield defines the address phase mode of operation.

00: No address

01: Address on a single line

10: Address on two lines

11: Address on four lines

*Note: This bitfield can be written only when BUSY = 0.*

Bits 9:8 **IMODE[1:0]**: Instruction mode

This bitfield defines the instruction phase mode of operation.

00: No instruction

01: Instruction on a single line

10: Instruction on two lines

11: Instruction on four lines

*Note: This bitfield can be written only when BUSY = 0.*

Bits 7:0 **INSTRUCTION[7:0]**: Instruction

Instruction to be sent to the external SPI device.

*Note: This bitfield can be written only when BUSY = 0.*

### 17.6.7 QUADSPI address register (QUADSPI\_AR)

Address offset: 0x018

Reset value: 0x0000 0000

|                |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ADDRESS[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw             | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ADDRESS[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw             | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ADDRESS[31:0]**: Address

This bitfield contains the address to be sent to the external flash memory.

Writes to this bitfield are ignored when BUSY = 1 or when FMODE = 11 (memory-mapped mode).

In dual flash mode, ADDRESS[0] is automatically stuck to 0 as the address must always be even

### 17.6.8 QUADSPI alternate-byte register (QUADSPI\_ABR)

Address offset: 0x01C

Reset value: 0x0000 0000

|                  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31               | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ALTERNATE[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw               | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15               | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ALTERNATE[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw               | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ALTERNATE[31:0]**: Alternate bytes

Optional data to be send to the external SPI device right after the address.

*Note: This bitfield can be written only when BUSY = 0.*

### 17.6.9 QUADSPI data register (QUADSPI\_DR)

Address offset: 0x020

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DATA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DATA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: Data

Data to be sent/received to/from the external SPI device.

In indirect write mode, data written to this register is stored on the FIFO before it is sent to the flash memory during the data phase. If the FIFO is too full, a write operation is stalled until the FIFO has enough space to accept the amount of data being written.

In indirect read mode, reading this register gives (via the FIFO) the data which was received from the flash memory. If the FIFO does not have as many bytes as requested by the read operation and if BUSY=1, the read operation is stalled until enough data is present or until the transfer is complete, whichever happens first.

In automatic status-polling mode, this register contains the last data read from the flash memory (without masking).

Word, halfword, and byte accesses to this register are supported. In indirect write mode, a byte write adds 1 byte to the FIFO, a halfword write 2, and a word write 4. Similarly, in indirect read mode, a byte read removes 1 byte from the FIFO, a halfword read 2, and a word read 4. Accesses in indirect mode must be aligned to the bottom of this register: a byte read must read DATA[7:0] and a halfword read must read DATA[15:0].

### 17.6.10 QUADSPI polling status mask register (QUADSPI\_PSMKR)

Address offset: 0x024

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MASK[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MASK[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MASK[31:0]**: Status mask

Mask to be applied to the status bytes received in automatic status-polling mode.

For bit n:

0: Bit n of the data received in automatic status-polling mode is masked and its value is not considered in the matching logic

1: Bit n of the data received in automatic status-polling mode is unmasked and its value is considered in the matching logic

*Note: This bitfield can be written only when BUSY = 0.*

### 17.6.11 QUADSPI polling status match register (QUADSPI\_PSMAR)

Address offset: 0x028

Reset value: 0x0000 0000

|              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MATCH[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW           | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MATCH[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW           | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:0 **MATCH[31:0]**: Status match

Value to be compared with the masked status register to get a match.

*Note: This bitfield can be written only when BUSY = 0.*

### 17.6.12 QUADSPI polling interval register (QUADSPI\_PIR)

Address offset: 0x02C

Reset value: 0x0000 0000

|                |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|----------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31             | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.           | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|                |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15             | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| INTERVAL[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rW             | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INTERVAL[15:0]**: Polling interval

Number of CLK cycles between two read during automatic status-polling phases.

*Note: This bitfield can be written only when BUSY = 0.*

Reset value: 0x0000 0000

[illegible]

*Note: This bitfield can be written only when BUSY = 0.*

[illegible]

Table 102. QUADSPI register map and reset values (continued)

| Offset | Register name | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15             | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------|---------------|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 0x024  | QUADSPI_PSMKR | MASK[31:0]  |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |                |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|        | Reset value   | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0              | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0x028  | QUADSPI_PSMAR | MATCH[31:0] |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |                |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

Refer to [Section 2.2](#) for the register boundary addresses.

## 18 Analog-to-digital converters (ADC)

### 18.1 Introduction

This section describes the implementation of up to 3 ADCs:

- ADC1 and ADC2 are tightly coupled and can operate in dual mode (ADC1 is master).
- ADC3 is controlled independently.

Each ADC consists of a 12-bit successive approximation analog-to-digital converter.

Each ADC has up to 20 multiplexed channels. A/D conversion of the various channels can be performed in single, continuous, scan or discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned 16-bit data register.

The ADCs are mapped on the AHB bus to allow fast data handling.

The analog watchdog features allow the application to detect if the input voltage goes outside the user-defined high or low thresholds.

A built-in hardware oversampler allows to improve analog performance while off-loading the related computational burden from the CPU.

An efficient low-power mode is implemented to allow very low consumption at low frequency.

## 18.2 ADC main features

- High-performance features
  - Up to 3 ADCs, out of which two of them can operate in dual mode:
    - ADC1 is connected to 16 external channels + 3 internal channels
    - ADC2 is connected to 16 external channels + 2 internal channels
    - ADC3 is connected to 12 external channels + 4 internal channels
  - 12, 10, 8 or 6-bit configurable resolution
  - ADC conversion time is independent from the AHB bus clock frequency
  - Faster conversion time by lowering resolution
  - Manage single-ended or differential inputs
  - AHB slave bus interface to allow fast data handling
  - Self-calibration
  - Channel-wise programmable sampling time
  - Up to four injected channels (analog inputs assignment to regular or injected channels is fully configurable)
  - Hardware assistant to prepare the context of the injected channels to allow fast context switching
  - Data alignment with in-built data coherency
  - Data can be managed by DMA for regular channel conversions
  - Data can be routed to DFSDM for post processing
  - 4 dedicated data registers for the injected channels
- Oversampler
  - 16-bit data register
  - Oversampling ratio adjustable from 2 to 256
  - Programmable data shift up to 8-bit
- Low-power features
  - Speed adaptive low-power mode to reduce ADC consumption when operating at low frequency
  - Allows slow bus frequency application while keeping optimum ADC performance
  - Provides automatic control to avoid ADC overrun in low AHB bus clock frequency

- application (auto-delayed mode)
- Number of external analog input channels per ADC
  - Up to 5 fast channels from GPIO pads
  - Up to 11 slow channels from GPIO pads
- In addition, there are several internal dedicated channels
  - The internal reference voltage ( $V_{REFINT}$ ), connected to ADC1
  - The internal temperature sensor ( $V_{TS}$ ), connected to ADC1 and ADC3
  - The  $V_{BAT}$  monitoring channel ( $V_{BAT}/3$ ), connected to ADC1 and ADC3
  - DAC1 internal channels, connected to ADC2 and ADC3
- Start-of-conversion can be initiated:
  - By software for both regular and injected conversions
  - By hardware triggers with configurable polarity (internal timers events or GPIO input events) for both regular and injected conversions
- Conversion modes
  - Each ADC can convert a single channel or can scan a sequence of channels
  - Single mode converts selected inputs once per trigger
  - Continuous mode converts selected inputs continuously
  - Discontinuous mode
- Dual ADC mode for ADC1 and 2
- Interrupt generation at ADC ready, the end of sampling, the end of conversion (regular or injected), end of sequence conversion (regular or injected), analog watchdog 1, 2 or 3 or overrun events
- 3 analog watchdogs per ADC
- ADC input range:  $V_{REF-} \leq V_{IN} \leq V_{REF+}$

*Figure 66* shows the block diagram of one ADC.

## 18.3 ADC implementation

**Table 103. ADC features**

| ADC modes/features             | ADC1 | ADC2 | ADC3 |
|--------------------------------|------|------|------|
| Dual mode                      | X    | X    | X    |
| DFSDM interface <sup>(1)</sup> | X    | X    | X    |
| SMPPLUS control <sup>(1)</sup> | X    | X    | X    |

| VREF+                         | Input, analog reference positive            | The higher/positive reference voltage for the ADC                                                                                                                   |
| VDDA                          | Input, analog supply                        | Analog power supply equal V <sub>DDA</sub>                                                                                                                          |
| VREF-                         | Input, analog reference negative            | The lower/negative reference voltage for the ADC. V <sub>REF-</sub> is internally connected to V <sub>SSA</sub>                                                     |
| VSSA                          | Input, analog supply ground                 | Ground for analog power supply. On device package which do not have a dedicated V <sub>SSA</sub> pin, V <sub>SSA</sub> is internally connected to V <sub>SS</sub> . |
| V <sub>INP</sub> <sub>i</sub> | Positive analog input channels for each ADC | Connected either to ADCx_INP <sub>i</sub> external channels or to internal channels. This input is converted in single-ended mode                                   |
| V <sub>INN</sub> <sub>i</sub> | Negative analog input channels for each ADC | Connected either to V <sub>REF-</sub> or to external channels: ADCx_INN <sub>i</sub> and ADCx_INP <sub>[i+1]</sub> .                                                |
| ADCx_INN <sub>i</sub>         | Negative external analog input signals      | Up to 16 analog input channels (x = ADC number = 1,2 or 3)<br>Refer to <a href="#">Section 18.4.4: ADC1/2/3 connectivity</a> for details.                           |
| ADCx_INP <sub>i</sub>         | Positive external analog input signals      | Up to 10 analog input channels (x = ADC number = 1,2 or 3)<br>Refer to <a href="#">Section 18.4.4: ADC1/2/3 connectivity</a> for details                            |

### 18.4.3 ADC clocks

#### Dual clock domain architecture

The dual clock-domain architecture means that the ADC clock is independent from the AHB bus clock.

The input clock is the same for all ADCs and can be selected between two different clock sources (see [Figure 67: ADC clock scheme](#)):

1. The ADC clock can be a specific clock source, derived from the following clock sources:

- The system clock
- PLLSAI1 (single ADC implementation)
- PLLSAI2

Refer to RCC Section for more information on how to generate ADC dedicated clock. To select this scheme, bits CKMODE[1:0] of the ADCx\_CCR register must be reset.

2. The ADC clock can be derived from the AHB clock of the ADC bus interface, divided by a programmable factor (1, 2 or 4). In this mode, a programmable divider factor can be selected (/1, 2 or 4 according to bits CKMODE[1:0]).

To select this scheme, bits CKMODE[1:0] of the ADCx\_CCR register must be different from 00.

**Note:** *For option 2), a prescaling factor of 1 (CKMODE[1:0] = 01) can be used only if the AHB prescaler is set (HPRE[3:0] = 0xxx in RCC\_CFGR register).*

Option 1) has the advantage of reaching the maximum ADC clock frequency whatever the AHB clock scheme selected. The ADC clock can eventually be divided by the following ratio: 1, 2, 4, 6, 8, 12, 16, 32, 64, 128, 256; using the prescaler configured with bits PRESC[3:0] in the ADCx\_CCR register.

Option 2) has the advantage of bypassing the clock domain resynchronizations. This can be useful when the ADC is triggered by a timer and if the application requires that the ADC is precisely triggered without any uncertainty (otherwise, an uncertainty of the trigger instant time is added by the resynchronizations between the two clock domains).

Figure 67. ADC clock scheme

### Clock ratio constraint between ADC clock and AHB clock

There are generally no constraints to be respected for the ratio between the ADC clock and the AHB clock except if some injected channels are programmed. In this case, it is mandatory to respect the following ratio:

- $F_{HCLK} \geq F_{ADC} / 4$  if the resolution of all channels are 12-bit or 10-bit
- $F_{HCLK} \geq F_{ADC} / 3$  if there are some channels with resolutions equal to 8-bit (and none with lower resolution)
- $F_{HCLK} \geq F_{ADC} / 2$  if there are some channels with resolutions equal to 6-bit

### 18.4.4 ADC1/2/3 connectivity

ADC1, ADC2 and ADC3 are tightly coupled and share some external channels as described in the below figures.

**Figure 68. ADC1 connectivity**

Figure 69. ADC2 connectivity

Figure 70. ADC3 connectivity

### 18.4.5 Slave AHB interface

The ADCs implement an AHB slave port for control/status register and data access. The features of the AHB interface are listed below:

- Word (32-bit) accesses
- Single cycle response
- Response to all read/write accesses to the registers with zero wait states.

The AHB slave interface does not support split/retry requests, and never generates AHB errors.

### 18.4.6 ADC Deep-power-down mode (DEEPPWD) and ADC voltage regulator (ADVREGEN)

By default, the ADC is in Deep-power-down mode where its supply is internally switched off to reduce the leakage currents (the reset state of bit DEEPPWD is 1 in the ADC\_CR register).

To start ADC operations, follow the sequence below:

1. Exit Deep-power-down mode by clearing DEEPPWD bit.
2. Enable the ADC voltage regulator by setting ADVREGEN.
3. Wait for the startup time to configure the ADC (refer to the device datasheet for the value of the startup time).

When ADC operations are complete, the ADC can be disabled (ADEN = 0). It is possible to save power by also disabling the ADC voltage regulator. This is done by writing bit ADVREGEN = 0.

Then, to save more power by reducing the leakage currents, it is also possible to re-enter in ADC Deep-power-down mode by setting bit DEEPPWD = 1 into ADC\_CR register. This is particularly interesting before entering Stop mode.

*Note: Writing DEEPPWD = 1 automatically disables the ADC voltage regulator and bit ADVREGEN is automatically cleared.*

*When the internal voltage regulator is disabled (ADVREGEN = 0), the internal analog calibration is kept.*

In ADC Deep-power-down mode (DEEPPWD = 1), the internal analog calibration is lost and it is necessary to either relaunch a calibration or re-apply the calibration factor which was previously saved (refer to [Section 18.4.8: Calibration \(ADCAL, ADCALDIF, ADC\\_CALFACT\)](#)).

Before entering Stop 2 mode, the ADC needs to be disabled by setting ADDIS and clearing ADVREGEN.

### 18.4.7 Single-ended and differential input channels

Channels can be configured to be either single-ended input or differential input by programming DIFSEL[i] bits in the ADC\_DIFSEL register. This configuration must be written while the ADC is disabled (ADEN = 0). Note that the DIFSEL[i] bits corresponding to single-ended channels are always programmed at 0.

In single-ended input mode, the analog voltage to be converted for channel “i” is the difference between the ADCy\_INPx external voltage equal to  $V_{INP[i]}$  (positive input) and  $V_{REF-}$  (negative input).

In differential input mode, the analog voltage to be converted for channel “i” is the difference between the ADCy\_INPx external voltage positive input equal to  $V_{INP[i]}$ , and the ADCy\_INNx negative input equal to  $V_{INN[i]}$ .

The input voltage in differential mode ranges from  $V_{REF-}$  to  $V_{REF+}$ , which makes a full scale range of  $2 \times V_{REF+}$ . When  $V_{INP[i]}$  equals  $V_{REF-}$ ,  $V_{INN[i]}$  equals  $V_{REF+}$  and the maximum negative input differential voltage ( $V_{REF-}$ ) corresponds to 0x000 ADC output. When  $V_{INP[i]}$  equals  $V_{REF+}$ ,  $V_{INN[i]}$  equals  $V_{REF-}$  and the maximum positive input differential voltage ( $V_{REF+}$ ) corresponds to 0xFFF ADC output. When  $V_{INP[i]}$  and  $V_{INN[i]}$  are connected together, the zero input differential voltage corresponds to 0x800 ADC output.

The ADC sensitivity in differential mode is twice smaller than in single-ended mode.

When ADC is configured as differential mode, both inputs should be biased at  $(V_{REF+}) / 2$  voltage. Refer to the device datasheet for the allowed common mode input voltage  $V_{CMIN}$ .

The input signals are supposed to be differential (common mode voltage should be fixed).

Internal channels (such as  $V_{TS}$  and  $V_{REFINT}$ ) are used in single-ended mode only.

For a complete description of how the input channels are connected for each ADC, refer to [Section 18.4.4: ADC1/2/3 connectivity](#).

**Caution:** When configuring the channel “i” in differential input mode, its negative input voltage  $V_{INN[i]}$  is connected to another channel. As a consequence, this channel is no longer usable in single-ended mode or in differential mode and must never be configured to be converted. Some channels are shared between ADC1/ADC2/ADC3: this can make the channel on the other ADC unusable. Only exception is interleaved mode for ADC master and the slave.

### 18.4.8 Calibration (ADCAL, ADCALDIF, ADC\_CALFACT)

Each ADC provides an automatic calibration procedure which drives all the calibration sequence including the power-on/off sequence of the ADC. During the procedure, the ADC calculates a calibration factor which is 7-bit wide and which is applied internally to the ADC until the next ADC power-off. During the calibration procedure, the application must not use the ADC and must wait until calibration is complete.

Calibration is preliminary to any ADC operation. It removes the offset error which may vary from chip to chip due to process or bandgap variation.

The calibration factor to be applied for single-ended input conversions is different from the factor to be applied for differential input conversions:

- Write ADCALDIF = 0 before launching a calibration to be applied for single-ended input conversions.
- Write ADCALDIF = 1 before launching a calibration to be applied for differential input conversions.

The calibration is then initiated by software by setting bit ADCAL = 1. Calibration can only be initiated when the ADC is disabled (when ADEN = 0). ADCAL bit stays at 1 during all the calibration sequence. It is then cleared by hardware as soon the calibration completes. At this time, the associated calibration factor is stored internally in the analog ADC and also in the bits CALFACT\_S[6:0] or CALFACT\_D[6:0] of ADC\_CALFACT register (depending on single-ended or differential input calibration)

The internal analog calibration is kept if the ADC is disabled (ADEN = 0). However, if the ADC is disabled for extended periods, then it is recommended that a new calibration cycle is run before re-enabling the ADC.

The internal analog calibration is lost each time the power of the ADC is removed (example, when the product enters in Standby or VBAT mode). In this case, to avoid spending time recalibrating the ADC, it is possible to re-write the calibration factor into the ADC\_CALFACT register without recalibrating, supposing that the software has previously saved the calibration factor delivered during the previous calibration.

The calibration factor can be written if the ADC is enabled but not converting (ADEN = 1 and ADSTART = 0 and JADSTART = 0). Then, at the next start of conversion, the calibration factor is automatically injected into the analog ADC. This loading is transparent and does not add any cycle latency to the start of the conversion. It is recommended to recalibrate when  $V_{REF+}$  voltage changed more than 10%.

### Software procedure to calibrate the ADC

1. Ensure DEEPPWD = 0, ADVREGEN = 1 and that ADC voltage regulator startup time has elapsed.
2. Ensure that ADEN = 0.
3. Select the input mode for this calibration by setting ADCALDIF = 0 (single-ended input) or ADCALDIF = 1 (differential input).
4. Set ADCAL.
5. Wait until ADCAL = 0.
6. The calibration factor can be read from ADC\_CALFACT register.

**Figure 71. ADC calibration**

### Software procedure to re-inject a calibration factor into the ADC

1. Ensure ADEN = 1 and ADSTART = 0 and JADSTART = 0 (ADC enabled and no conversion is ongoing).
2. Write CALFACT\_S and CALFACT\_D with the new calibration factors.
3. When a conversion is launched, the calibration factor is injected into the analog ADC only if the internal analog calibration factor differs from the one stored in bits CALFACT\_S for single-ended input channel or bits CALFACT\_D for differential input channel.

**Figure 72. Updating the ADC calibration factor**

### Converting single-ended and differential analog inputs with a single ADC

If the ADC is supposed to convert both differential and single-ended inputs, two calibrations must be performed, one with ADCALDIF = 0 and one with ADCALDIF = 1. The procedure is the following:

1. Disable the ADC.
2. Calibrate the ADC in single-ended input mode (with ADCALDIF = 0). This updates the register CALFACT\_S[6:0].
3. Calibrate the ADC in differential input modes (with ADCALDIF = 1). This updates the register CALFACT\_D[6:0].
4. Enable the ADC, configure the channels and launch the conversions. Each time there is a switch from a single-ended to a differential inputs channel (and vice-versa), the calibration is automatically injected into the analog ADC.

**Figure 73. Mixing single-ended and differential channels**

#### 18.4.9 ADC on-off control (ADEN, ADDIS, ADRDY)

First of all, follow the procedure explained in [Section 18.4.6: ADC Deep-power-down mode \(DEEPPWD\) and ADC voltage regulator \(ADVREGEN\)](#).

Once DEEPPWD = 0 and ADVREGEN = 1, the ADC can be enabled and the ADC needs a stabilization time of  $t_{STAB}$  before it starts converting accurately, as shown in [Figure 74](#). Two control bits enable or disable the ADC:

- ADEN = 1 enables the ADC. The flag ADRDY is set once the ADC is ready for operation.
- ADDIS = 1 disables the ADC. ADEN and ADDIS are then automatically cleared by hardware as soon as the analog ADC is effectively disabled.

Regular conversion can then start either by setting ADSTART = 1 (refer to [Section 18.4.18: Conversion on external trigger and trigger polarity \(EXTSEL, EXTEN, JEXTSEL, JEXTEN\)](#)) or when an external trigger event occurs, if triggers are enabled.

Injected conversions start by setting JADSTART = 1 or when an external injected trigger event occurs, if injected triggers are enabled.

##### Software procedure to enable the ADC

1. Clear the ADRDY bit in the ADC\_ISR register by writing 1.
2. Set ADEN.
3. Wait until ADRDY = 1 (ADRDY is set after the ADC startup time). This can be done using the associated interrupt (setting ADRDYIE = 1).
4. Clear the ADRDY bit in the ADC\_ISR register by writing 1 (optional).

**Caution:** ADEN bit cannot be set when ADCAL is set and during four ADC clock cycles after the ADCAL bit is cleared by hardware (end of the calibration).

### Software procedure to disable the ADC

1. Check that both ADSTART = 0 and JADSTART = 0 to ensure that no conversion is ongoing. If required, stop any regular and injected conversion ongoing by setting ADSTP = 1 and JADSTP = 1 and then wait until ADSTP = 0 and JADSTP = 0.
2. Set ADDIS.
3. If required by the application, wait until ADEN = 0, until the analog ADC is effectively disabled (ADDIS is automatically reset once ADEN = 0).

Figure 74. Enabling / disabling the ADC

#### 18.4.10 Constraints when writing the ADC control bits

The software is allowed to write the RCC control bits to configure and enable the ADC clock (refer to RCC Section), the DIFSEL[i] control bits in the ADC\_DIFSEL register and the control bits ADCAL and ADEN in the ADC\_CR register, only if the ADC is disabled (ADEN must be equal to 0).

The software is then allowed to write the control bits ADSTART, JADSTART and ADDIS of the ADC\_CR register only if the ADC is enabled and there is no pending request to disable the ADC (ADEN must be equal to 1 and ADDIS to 0).

For all the other control bits of the ADC\_CFGR, ADC\_SMPRx, ADC\_SQRy, ADC\_JDRy, ADC\_OFRy, ADC\_OFCHy and ADC\_IER registers:

- For control bits related to configuration of regular conversions, the software is allowed to write them only if the ADC is enabled (ADEN = 1) and if there is no regular conversion ongoing (ADSTART must be equal to 0).
- For control bits related to configuration of injected conversions, the software is allowed to write them only if the ADC is enabled (ADEN = 1) and if there is no injected conversion ongoing (JADSTART must be equal to 0).

The software is allowed to write the ADSTP or JADSTP control bits of the ADC\_CR register only if the ADC is enabled, possibly converting, and if there is no pending request to disable the ADC (ADSTART or JADSTART must be equal to 1 and ADDIS to 0).

The software can write the register ADC\_JSQR at any time, when the ADC is enabled (ADEN = 1). Refer to [Section 18.7.16: ADC injected sequence register \(ADC\\_JSQR\)](#) for additional details.

**Note:** *There is no hardware protection to prevent these forbidden write accesses and ADC behavior may become in an unknown state. To recover from this situation, the ADC must be disabled (clear ADEN as well as all the bits of ADC\_CR register).*

#### 18.4.11 Channel selection (SQRx, JSQRx)

There are up to 20 multiplexed channels per ADC:

- Up to 11 slow analog inputs coming from GPIO pads (ADCx\_INP/INN[6:16])  
Depending on the products, not all of them are available on GPIO pads.
- The ADCs are connected to the following internal analog inputs:
  - The internal reference voltage ( $V_{REFINT}$ ) is connected to ADC1\_INP0/INN0.
  - The internal temperature sensor ( $V_{TS}$ ) is connected to ADC1\_INP17/INN17 and ADC3\_INP/INN17.
  - The  $V_{BAT}$  monitoring channel ( $V_{BAT}/3$ ) is connected to ADC1\_INP18/INN18 and ADC3\_INP/INN18.
  - The DAC1 internal channel 1 is connected to ADC2\_INP/INN17 and ADC3\_INP/INN14.
  - The DAC1 internal channel 2 is connected to ADC2\_INP/INN18 and ADC3\_INP/INN15.

**Note:** *To convert one of the internal analog channels, the corresponding analog sources must first be enabled by programming bits VREFEN, CH17SEL or CH18SEL in the ADCx\_CCR registers.*

**Caution:** On STM32L47x/L48x devices, before any conversion of an input channel coming from GPIO pads, it is necessary to configure the corresponding GPIOx\_ASCR register in the GPIO, in addition to the I/O configuration in analog mode.

It is possible to organize the conversions in two groups: regular and injected. A group consists of a sequence of conversions that can be done on any channel and in any order. For instance, it is possible to implement the conversion sequence in the following order: ADCx\_INP/INN3, ADCx\_INP/INN8, ADCx\_INP/INN2, ADCx\_INN/INP2, ADCx\_INP/INN0, ADCx\_INP/INN2, ADCx\_INP/INN2, ADCx\_INP/INN15.

- A **regular group** is composed of up to 16 conversions. The regular channels and their order in the conversion sequence must be selected in the ADC\_SQRy registers. The total number of conversions in the regular group must be written in the L[3:0] bits in the ADC\_SQR1 register.
- An **injected group** is composed of up to 4 conversions. The injected channels and their order in the conversion sequence must be selected in the ADC\_JSQR register. The total number of conversions in the injected group must be written in the L[1:0] bits in the ADC\_JSQR register.

ADC\_SQRy registers must not be modified while regular conversions can occur. For this, the ADC regular conversions must be first stopped by writing ADSTP = 1 (refer to [Section 18.4.17: Stopping an ongoing conversion \(ADSTP, JADSTP\)](#)).

The software is allowed to modify on-the-fly the ADC\_JSQR register when JADSTART is set (injected conversions ongoing) only when the context queue is enabled (JQDIS = 0 in ADC\_CFGR register). Refer to [Section 18.4.21: Queue of context for injected conversions](#)

### 18.4.12 Channel-wise programmable sampling time (SMPR1, SMPR2)

Before starting a conversion, the ADC must establish a direct connection between the voltage source under measurement and the embedded sampling capacitor of the ADC. This sampling time must be enough for the input voltage source to charge the embedded capacitor to the input voltage level.

Each channel can be sampled with a different sampling time which is programmable using the SMP[2:0] bits in the ADC\_SMPR1 and ADC registers. It is therefore possible to select among the following sampling time values:

- SMP = 000: 2.5 ADC clock cycles
- SMP = 001: 6.5 ADC clock cycles
- SMP = 010: 12.5 ADC clock cycles
- SMP = 011: 24.5 ADC clock cycles
- SMP = 100: 47.5 ADC clock cycles
- SMP = 101: 92.5 ADC clock cycles
- SMP = 110: 247.5 ADC clock cycles
- SMP = 111: 640.5 ADC clock cycles

The total conversion time is calculated as follows:

$$T_{\text{CONV}} = \text{Sampling time} + 12.5 \text{ ADC clock cycles}$$

Example:

With  $F_{\text{ADC\_CLK}} = 30 \text{ MHz}$  and a sampling time of 2.5 ADC clock cycles:

$$T_{\text{CONV}} = (2.5 + 12.5) \text{ ADC clock cycles} = 15 \text{ ADC clock cycles} = 500 \text{ ns}$$

The ADC notifies the end of the sampling phase by setting the status bit EOSMP (only for regular conversion).

#### Constraints on the sampling time

For each channel, SMP[2:0] bits must be programmed to respect a minimum sampling time as specified in the ADC characteristics section of the datasheets.

#### I/O analog switch voltage booster

The resistance of the I/O analog switches increases when the  $V_{\text{DDA}}$  voltage is too low. The sampling time must consequently be adapted accordingly (refer to the device datasheet for the corresponding electrical characteristics). This resistance can be minimized at low  $V_{\text{DDA}}$  voltage by enabling an internal voltage booster through the BOOSTEN bit of the SYSCFG\_CFGR1 register.

#### SMPPLUS control bit

When a sampling time of 2.5 ADC clock cycles is selected, the total conversion time becomes 15 cycles in 12-bit mode. If the dual interleaved mode is used (see [Section : Interleaved mode with independent injected](#)), the sampling interval cannot be equal to the value specified since an even number of cycles is required for the conversion. The SMPPLUS bit can be used to change the sampling time 2.5 ADC clock cycles into 3.5 ADC clock cycles. In this way, the total conversion time becomes 16 clock cycles, thus making possible to interleave every 8 cycles.

### 18.4.13 Single conversion mode (CONT = 0)

In Single conversion mode, the ADC performs once all the conversions of the channels. This mode is started with the CONT bit at 0 by either:

- Setting the ADSTART bit in the ADC\_CR register (for a regular channel)
- Setting the JADSTART bit in the ADC\_CR register (for an injected channel)
- External hardware trigger event (for a regular or injected channel)

Inside the regular sequence, after each conversion is complete:

- The converted data are stored into the 16-bit ADC\_DR register
- The EOC (end of regular conversion) flag is set
- An interrupt is generated if the EOCIE bit is set

Inside the injected sequence, after each conversion is complete:

- The converted data are stored into one of the four 16-bit ADC\_JDRy registers
- The JEOC (end of injected conversion) flag is set
- An interrupt is generated if the JEOCIE bit is set

After the regular sequence is complete:

- The EOS (end of regular sequence) flag is set
- An interrupt is generated if the EOSIE bit is set

After the injected sequence is complete:

- The JEOS (end of injected sequence) flag is set
- An interrupt is generated if the JEOSIE bit is set

Then the ADC stops until a new external regular or injected trigger occurs or until bit ADSTART or JADSTART is set again.

*Note:* To convert a single channel, program a sequence with a length of 1.

### 18.4.14 Continuous conversion mode (CONT = 1)

This mode applies to regular channels only.

In continuous conversion mode, when a software or hardware regular trigger event occurs, the ADC performs once all the regular conversions of the channels and then automatically restarts and continuously converts each conversions of the sequence. This mode is started with the CONT bit at 1 either by external trigger or by setting the ADSTART bit in the ADC\_CR register.

Inside the regular sequence, after each conversion is complete:

- The converted data are stored into the 16-bit ADC\_DR register
- The EOC (end of conversion) flag is set
- An interrupt is generated if the EOCIE bit is set

After the sequence of conversions is complete:

- The EOS (end of sequence) flag is set
- An interrupt is generated if the EOSIE bit is set

Then, a new sequence restarts immediately and the ADC continuously repeats the conversion sequence.

**Note:** To convert a single channel, program a sequence with a length of 1.

It is not possible to have both discontinuous mode and continuous mode enabled: it is forbidden to set both  $DISCEN = 1$  and  $CONT = 1$ .

Injected channels cannot be converted continuously. The only exception is when an injected channel is configured to be converted automatically after regular channels in continuous mode (using  $JAUTO$  bit), refer to [Auto-injection mode](#) section).

#### 18.4.15 Starting conversions (ADSTART, JADSTART)

Software starts ADC regular conversions by setting  $ADSTART = 1$ .

When  $ADSTART$  is set, the conversion starts:

- Immediately: if  $EXTEN[1:0] = 00$  (software trigger)
- At the next active edge of the selected regular hardware trigger: if  $EXTEN[1:0]$  is not equal to 00

Software starts ADC injected conversions by setting  $JADSTART = 1$ .

When  $JADSTART$  is set, the conversion starts:

- Immediately, if  $JEXTEN[1:0] = 00$  (software trigger)
- At the next active edge of the selected injected hardware trigger: if  $JEXTEN[1:0]$  is not equal to 00

**Note:** In auto-injection mode ( $JAUTO = 1$ ), use  $ADSTART$  bit to start the regular conversions followed by the auto-injected conversions ( $JADSTART$  must be kept cleared).

$ADSTART$  and  $JADSTART$  also provide information on whether any ADC operation is currently ongoing. It is possible to re-configure the ADC while  $ADSTART = 0$  and  $JADSTART = 0$  are both true, indicating that the ADC is idle.

$ADSTART$  is cleared by hardware:

- In single mode with software regular trigger ( $CONT = 0$ ,  $EXTSEL = 0x0$ )
  - At any end of regular conversion sequence (EOS assertion) or at any end of subgroup processing if  $DISCEN = 1$
- In all cases ( $CONT=x$ ,  $EXTSEL=x$ )
  - After execution of the  $ADSTP$  procedure asserted by the software.

**Note:** In continuous mode ( $CONT = 1$ ),  $ADSTART$  is not cleared by hardware with the assertion of EOS because the sequence is automatically relaunched.

When a hardware trigger is selected in single mode ( $CONT = 0$  and  $EXTSEL \neq 0x00$ ),  $ADSTART$  is not cleared by hardware with the assertion of EOS to help the software which does not need to reset  $ADSTART$  again for the next hardware trigger event. This ensures that no further hardware triggers are missed.

$JADSTART$  is cleared by hardware:

- In single mode with software injected trigger ( $JEXTSEL = 0x0$ )
  - At any end of injected conversion sequence (JEOS assertion) or at any end of subgroup processing if  $JDISCEN = 1$
- in all cases ( $JEXTSEL=x$ )
  - After execution of the  $JADSTP$  procedure asserted by the software.

**Note:** When the software trigger is selected,  $ADSTART$  bit should not be set if the EOC flag is still high.

### 18.4.16 ADC timing

The elapsed time between the start of a conversion and the end of conversion is the sum of the configured sampling time plus the successive approximation time depending on data resolution:

$$T_{\text{CONV}} = T_{\text{SMPL}} + T_{\text{SAR}} = [2.5_{\text{min}} + 12.5_{\text{12bit}}] \times T_{\text{ADC\_CLK}}$$

$$T_{\text{CONV}} = T_{\text{SMPL}} + T_{\text{SAR}} = 83.33 \text{ ns}_{\text{min}} + 416.67 \text{ ns}_{\text{12bit}} = 500.0 \text{ ns (for } F_{\text{ADC\_CLK}} = 30 \text{ MHz)}$$

**Figure 75. Analog to digital conversion time**

1.  $T_{\text{SMPL}}$  depends on SMP[2:0].

2.  $T_{\text{SAR}}$  depends on RES[2:0].

### 18.4.17 Stopping an ongoing conversion (ADSTP, JADSTP)

The software can decide to stop regular conversions ongoing by setting ADSTP = 1 and injected conversions ongoing by setting JADSTP = 1.

Stopping conversions resets the ongoing ADC operation. Then the ADC can be reconfigured (ex: changing the channel selection or the trigger) ready for a new operation.

Note that it is possible to stop injected conversions while regular conversions are still operating and vice-versa. This allows, for instance, re-configuration of the injected conversion sequence and triggers while regular conversions are still operating (and vice-versa).

When the ADSTP bit is set by software, any ongoing regular conversion is aborted with partial result discarded (ADC\_DR register is not updated with the current conversion).

When the JADSTP bit is set by software, any ongoing injected conversion is aborted with partial result discarded (ADC\_JDRy register is not updated with the current conversion). The scan sequence is also aborted and reset (meaning that relaunching the ADC would restart a new sequence).

Once this procedure is complete, bits ADSTP/ADSTART (in case of regular conversion), or JADSTP/JADSTART (in case of injected conversion) are cleared by hardware and the software must poll ADSTART (or JADSTART) until the bit is reset before assuming the ADC is completely stopped.

*Note:* In auto-injection mode ( $JAUTO = 1$ ), setting  $ADSTP$  bit aborts both regular and injected conversions ( $JADSTP$  must not be used).

**Figure 76. Stopping ongoing regular conversions**

**Figure 77. Stopping ongoing regular and injected conversions**

### 18.4.18 Conversion on external trigger and trigger polarity (EXTSEL, EXTEN, JEXTSEL, JEXTEN)

A conversion or a sequence of conversions can be triggered either by software or by an external event (e.g. timer capture, input pins). If the EXTEN[1:0] control bits (for a regular conversion) or JEXTEN[1:0] bits (for an injected conversion) are different from 00, then external events are able to trigger a conversion with the selected polarity.

When the Injected Queue is enabled (bit JQDIS = 0), injected software triggers are not possible.

The regular trigger selection is effective once software has set bit ADSTART = 1 and the injected trigger selection is effective once software has set bit JADSTART = 1.

Any hardware triggers which occur while a conversion is ongoing are ignored.

- If bit ADSTART = 0, any regular hardware triggers which occur are ignored.
- If bit JADSTART = 0, any injected hardware triggers which occur are ignored.

[Table 106](#) provides the correspondence between the EXTEN[1:0] and JEXTEN[1:0] values and the trigger polarity.

**Table 106. Configuring the trigger polarity for regular external triggers**

| EXTEN[1:0] | Source                                                                  |
|------------|-------------------------------------------------------------------------|
| 00         | Hardware Trigger detection disabled, software trigger detection enabled |
| 01         | Hardware Trigger with detection on the rising edge                      |
| 10         | Hardware Trigger with detection on the falling edge                     |
| 11         | Hardware Trigger with detection on both the rising and falling edges    |

*Note:* The polarity of the regular trigger cannot be changed on-the-fly.

**Table 107. Configuring the trigger polarity for injected external triggers**

| JEXTEN[1:0] | Source                                                                                                                                                                                                                                               |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00          | <ul style="list-style-type: none"> <li>– If JQDIS = 1 (Queue disabled): Hardware trigger detection disabled, software trigger detection enabled</li> <li>– If JQDIS = 0 (Queue enabled), Hardware and software trigger detection disabled</li> </ul> |
| 01          | Hardware Trigger with detection on the rising edge                                                                                                                                                                                                   |
| 10          | Hardware Trigger with detection on the falling edge                                                                                                                                                                                                  |
| 11          | Hardware Trigger with detection on both the rising and falling edges                                                                                                                                                                                 |

*Note:* The polarity of the injected trigger can be anticipated and changed on-the-fly when the queue is enabled (JQDIS = 0). Refer to [Section 18.4.21: Queue of context for injected conversions](#).

The EXTSEL and JEXTSEL control bits select which out of 16 possible events can trigger conversion for the regular and injected groups.

A regular group conversion can be interrupted by an injected trigger.

**Note:** The regular trigger selection cannot be changed on-the-fly.  
The injected trigger selection can be anticipated and changed on-the-fly. Refer to [Section 18.4.21: Queue of context for injected conversions on page 526](#)

Each ADC master shares the same input triggers with its ADC slave as described in [Figure 78](#).

**Figure 78. Triggers sharing between ADC master and ADC slave**

[Table 108](#) to [Table 109](#) give all the possible external triggers of the three ADCs for regular and injected conversions.

**Table 108. ADC1, ADC2 and ADC3 - External triggers for regular channels**

| Name | Source       | Type                                | EXTSEL[3:0] |

## 18.4.19 Injected channel management

### Triggered injection mode

To use triggered injection, the JAUTO bit in the ADC\_CFGR register must be cleared.

1. Start the conversion of a group of regular channels either by an external trigger or by setting the ADSTART bit in the ADC\_CR register.
2. If an external injected trigger occurs, or if the JADSTART bit in the ADC\_CR register is set during the conversion of a regular group of channels, the current conversion is

- reset and the injected channel sequence switches are launched (all the injected channels are converted once).
3. Then, the regular conversion of the regular group of channels is resumed from the last interrupted regular conversion.
  4. If a regular event occurs during an injected conversion, the injected conversion is not interrupted but the regular sequence is executed at the end of the injected sequence. [Figure 79](#) shows the corresponding timing diagram.

**Note:** *When using triggered injection, one must ensure that the interval between trigger events is longer than the injection sequence. For instance, if the sequence length is 30 ADC clock cycles (that is two conversions with a sampling time of 2.5 clock periods), the minimum interval between triggers must be 31 ADC clock cycles.*

### Auto-injection mode

If the JAUTO bit in the ADC\_CFGR register is set, then the channels in the injected group are automatically converted after the regular group of channels. This can be used to convert a sequence of up to 20 conversions programmed in the ADC\_SQRy and ADC\_JSQR registers.

In this mode, the ADSTART bit in the ADC\_CR register must be set to start regular conversions, followed by injected conversions (JADSTART must be kept cleared). Setting the ADSTP bit aborts both regular and injected conversions (JADSTP bit must not be used).

In this mode, external trigger on injected channels must be disabled.

If the CONT bit is also set in addition to the JAUTO bit, regular channels followed by injected channels are continuously converted.

**Note:** *It is not possible to use both the auto-injected and discontinuous modes simultaneously.*  
*When the DMA is used for exporting regular sequencer's data in JAUTO mode, it is necessary to program it in circular mode (CIRC bit set in DMA\_CCRx register). If the CIRC bit is reset (single-shot mode), the JAUTO sequence is stopped upon DMA Transfer Complete event.*

Figure 79. Injected conversion latency

1. The maximum latency value can be found in the electrical characteristics of the device datasheet.

#### 18.4.20 Discontinuous mode (DISCEN, DISCNUM, JDISCEN)

##### Regular group mode

This mode is enabled by setting the DISCEN bit in the ADC\_CFGR register.

It is used to convert a short sequence (subgroup) of  $n$  conversions ( $n \leq 8$ ) that is part of the sequence of conversions selected in the ADC\_SQRY registers. The value of  $n$  is specified by writing to the DISCNUM[2:0] bits in the ADC\_CFGR register.

When an external trigger occurs, it starts the next  $n$  conversions selected in the ADC\_SQRY registers until all the conversions in the sequence are done. The total sequence length is defined by the L[3:0] bits in the ADC\_SQR1 register.

Example:

- DISCEN = 1,  $n = 3$ , channels to be converted = 1, 2, 3, 6, 7, 8, 9, 10, 11
  - 1st trigger: channels converted are 1, 2, 3 (an EOC event is generated at each conversion).
  - 2nd trigger: channels converted are 6, 7, 8 (an EOC event is generated at each conversion).
  - 3rd trigger: channels converted are 9, 10, 11 (an EOC event is generated at each conversion) and an EOS event is generated after the conversion of channel 11.
  - 4th trigger: channels converted are 1, 2, 3 (an EOC event is generated at each conversion).
  - ...
- DISCEN = 0, channels to be converted = 1, 2, 3, 6, 7, 8, 9, 10, 11
  - 1st trigger: the complete sequence is converted: channel 1, then 2, 3, 6, 7, 8, 9, 10 and 11. Each conversion generates an EOC event and the last one also generates an EOS event.
  - All the next trigger events relaunch the complete sequence.

**Note:** *The channel numbers referred to in the above example might not be available on all microcontrollers.*

*When a regular group is converted in discontinuous mode, no rollover occurs (the last subgroup of the sequence can have less than n conversions).*

*When all subgroups are converted, the next trigger starts the conversion of the first subgroup. In the example above, the 4th trigger reconverts the channels 1, 2 and 3 in the 1st subgroup.*

*It is not possible to have both discontinuous mode and continuous mode enabled. In this case (if DISCEN = 1, CONT = 1), the ADC behaves as if continuous mode was disabled.*

### Injected group mode

This mode is enabled by setting the JDISCEN bit in the ADC\_CFGR register. It converts the sequence selected in the ADC\_JSQR register, channel by channel, after an external injected trigger event. This is equivalent to discontinuous mode for regular channels where 'n' is fixed to 1.

When an external trigger occurs, it starts the next channel conversions selected in the ADC\_JSQR registers until all the conversions in the sequence are done. The total sequence length is defined by the JL[1:0] bits in the ADC\_JSQR register.

Example:

- JDISCEN = 1, channels to be converted = 1, 2, 3
  - 1st trigger: channel 1 converted (a JEOC event is generated)
  - 2nd trigger: channel 2 converted (a JEOC event is generated)
  - 3rd trigger: channel 3 converted and a JEOC event + a JEOS event are generated
  - ...

**Note:** *The channel numbers referred to in the above example might not be available on all microcontrollers.*

*When all injected channels have been converted, the next trigger starts the conversion of the first injected channel. In the example above, the 4th trigger reconverts the 1st injected channel 1.*

*It is not possible to use both auto-injected mode and discontinuous mode simultaneously: the bits DISCEN and JDISCEN must be kept cleared by software when JAUTO is set.*

### 18.4.21 Queue of context for injected conversions

A queue of context is implemented to anticipate up to 2 contexts for the next injected sequence of conversions. JQDIS bit of ADC\_CFGR register must be reset to enable this feature. Only hardware-triggered conversions are possible when the context queue is enabled.

This context consists of:

- Configuration of the injected triggers (bits JEXTEN[1:0] and JEXTSEL bits in ADC\_JSQR register)
- Definition of the injected sequence (bits JSQx[4:0] and JL[1:0] in ADC\_JSQR register)

All the parameters of the context are defined into a single register ADC\_JSQR and this register implements a queue of 2 buffers, allowing the bufferization of up to 2 sets of parameters:

- The JSQR register can be written at any moment even when injected conversions are ongoing.
- Each data written into the JSQR register is stored into the Queue of context.
- At the beginning, the Queue is empty and the first write access into the JSQR register immediately changes the context and the ADC is ready to receive injected triggers.
- Once an injected sequence is complete, the Queue is consumed and the context changes according to the next JSQR parameters stored in the Queue. This new context is applied for the next injected sequence of conversions.
- A Queue overflow occurs when writing into register JSQR while the Queue is full. This overflow is signaled by the assertion of the flag JQOVF. When an overflow occurs, the write access of JSQR register which has created the overflow is ignored and the queue of context is unchanged. An interrupt can be generated if bit JQOVFIE is set.
- Two possible behaviors are possible when the Queue becomes empty, depending on the value of the control bit JQM of register ADC\_CFGR:
  - If JQM = 0, the Queue is empty just after enabling the ADC, but then it can never be empty during run operations: the Queue always maintains the last active context and any further valid start of injected sequence is served according to the last active context.
  - If JQM = 1, the Queue can be empty after the end of an injected sequence or if the Queue is flushed. When this occurs, there is no more context in the queue and hardware triggers are disabled. Therefore, any further hardware injected triggers are ignored until the software re-writes a new injected context into JSQR register.
- Reading JSQR register returns the current JSQR context which is active at that moment. When the JSQR context is empty, JSQR is read as 0x0000.
- The Queue is flushed when stopping injected conversions by setting JADSTP = 1 or when disabling the ADC by setting ADDIS = 1:
  - If JQM = 0, the Queue is maintained with the last active context.
  - If JQM = 1, the Queue becomes empty and triggers are ignored.

**Note:** *When configured in discontinuous mode (bit JDISCEN = 1), only the last trigger of the injected sequence changes the context and consumes the Queue. The 1<sup>st</sup> trigger only consumes the queue but others are still valid triggers as shown by the discontinuous mode example below (length = 3 for both contexts):*

- *1<sup>st</sup> trigger, discontinuous. Sequence 1: context 1 consumed, 1<sup>st</sup> conversion carried out*
- *2<sup>nd</sup> trigger, discontinuous. Sequence 1: 2<sup>nd</sup> conversion.*
- *3<sup>rd</sup> trigger, discontinuous. Sequence 1: 3<sup>rd</sup> conversion.*
- *4<sup>th</sup> trigger, discontinuous. Sequence 2: context 2 consumed, 1<sup>st</sup> conversion carried out.*
- *5<sup>th</sup> trigger, discontinuous. Sequence 2: 2<sup>nd</sup> conversion.*
- *6<sup>th</sup> trigger, discontinuous. Sequence 2: 3<sup>rd</sup> conversion.*

Behavior when changing the trigger or sequence context

The [Figure 80](#) and [Figure 81](#) show the behavior of the context Queue when changing the sequence or the triggers.

Figure 80. Example of JSQR queue of context (sequence change)

1. Parameters:
- P1: sequence of 3 conversions, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 1
  - P3: sequence of 4 conversions, hardware trigger 1

Figure 81. Example of JSQR queue of context (trigger change)

1. Parameters:
- P1: sequence of 2 conversions, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 2
  - P3: sequence of 4 conversions, hardware trigger 1

### Queue of context: Behavior when a queue overflow occurs

The [Figure 82](#) and [Figure 83](#) show the behavior of the context Queue if an overflow occurs before or during a conversion.

**Figure 82. Example of JSQR queue of context with overflow before conversion**

- Parameters:
  - P1: sequence of 2 conversions, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 2
  - P3: sequence of 3 conversions, hardware trigger 1
  - P4: sequence of 4 conversions, hardware trigger 1

**Figure 83. Example of JSQR queue of context with overflow during conversion**

- Parameters:
  - P1: sequence of 2 conversions, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 2
  - P3: sequence of 3 conversions, hardware trigger 1
  - P4: sequence of 4 conversions, hardware trigger 1

It is recommended to manage the queue overflows as described below:

- After each P context write into JSQR register, flag JQOVF shows if the write has been ignored or not (an interrupt can be generated).
- Avoid Queue overflows by writing the third context (P3) only once the flag JEOS of the previous context P2 has been set. This ensures that the previous context has been consumed and that the queue is not full.

### Queue of context: Behavior when the queue becomes empty

Figure 84 and Figure 85 show the behavior of the context Queue when the Queue becomes empty in both cases JQM = 0 or 1.

**Figure 84. Example of JSQR queue of context with empty queue (case JQM = 0)**

- Parameters:
  - P1: sequence of 1 conversion, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 1
  - P3: sequence of 1 conversion, hardware trigger 1

**Note:** When writing P3, the context changes immediately. However, because of internal resynchronization, there is a latency and if a trigger occurs just after or before writing P3, it can happen that the conversion is launched considering the context P2. To avoid this situation, the user must ensure that there is no ADC trigger happening when writing a new context that applies immediately.

**Figure 85. Example of JSQR queue of context with empty queue (case JQM = 1)**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

### Flushing the queue of context

The figures below show the behavior of the context Queue in various situations when the queue is flushed.

**Figure 86. Flushing JSQR queue of context by setting JADSTP = 1 (JQM = 0)**  
**Case when JADSTP occurs during an ongoing conversion**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 87. Flushing JSQR queue of context by setting JADSTP = 1 (JQM = 0)**  
**Case when JADSTP occurs during an ongoing conversion and a new trigger occurs.**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 88. Flushing JSQR queue of context by setting JADSTP = 1 (JQM = 0)**  
**Case when JADSTP occurs outside an ongoing conversion**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 89. Flushing JSQR queue of context by setting JADSTP = 1 (JQM = 1)**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 90. Flushing JSQR queue of context by setting ADDIS = 1 (JQM = 0)**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 91. Flushing JSQR queue of context by setting ADDIS = 1 (JQM = 1)**

- Parameters:
  - P1: sequence of 1 conversion, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 1
  - P3: sequence of 1 conversion, hardware trigger 1

### Queue of context: Starting the ADC with an empty queue

The following procedure must be followed to start ADC operation with an empty queue, in case the first context is not known at the time the ADC is initialized. This procedure is only applicable when JQM bit is reset:

- Write a dummy JSQR with JEXTEN[1:0] not equal to 00 (otherwise triggering a software conversion).
- Set JADSTART.
- Set JADSTP.
- Wait until JADSTART is reset.
- Set JADSTART.

### Disabling the queue

It is possible to disable the queue by setting bit JQDIS = 1 into the ADC\_CFGR register.

## 18.4.22 Programmable resolution (RES) - Fast conversion mode

It is possible to perform faster conversion by reducing the ADC resolution.

The resolution can be configured to be either 12, 10, 8, or 6 bits by programming the control bits RES[1:0]. [Figure 96](#), [Figure 97](#), [Figure 98](#) and [Figure 99](#) show the conversion result format with respect to the resolution as well as to the data alignment.

Lower resolution allows faster conversion time for applications where high-data precision is not required. It reduces the conversion time spent by the successive approximation steps according to [Table 110](#).

Table 110.  $T_{SAR}$  timings depending on resolution

| RES<br>(bits) | $T_{SAR}$<br>(ADC clock cycles) | $T_{SAR}$ (ns) at<br>$F_{ADC} = 30$ MHz | $T_{CONV}$ (ADC clock cycles)<br>(with Sampling Time=<br>2.5 ADC clock cycles) | $T_{CONV}$ (ns) at<br>$F_{ADC} = 30$ MHz |
|---------------|---------------------------------|-----------------------------------------|--------------------------------------------------------------------------------|------------------------------------------|
| 12            | 12.5 ADC clock cycles           | 416.67 ns                               | 15 ADC clock cycles                                                            | 500.0 ns                                 |
| 10            | 10.5 ADC clock cycles           | 350.0 ns                                | 13 ADC clock cycles                                                            | 433.33 ns                                |
| 8             | 8.5 ADC clock cycles            | 203.33 ns                               | 11 ADC clock cycles                                                            | 366.67 ns                                |
| 6             | 6.5 ADC clock cycles            | 216.67 ns                               | 9 ADC clock cycles                                                             | 300.0 ns                                 |

#### 18.4.23 End of conversion, end of sampling phase (EOC, JEOC, EOSMP)

The ADC notifies the application for each end of regular conversion (EOC) event and each injected conversion (JEOC) event.

The ADC sets the EOC flag as soon as a new regular conversion data is available in the ADC\_DR register. An interrupt can be generated if bit EOCIE is set. EOC flag is cleared by the software either by writing 1 to it or by reading ADC\_DR.

The ADC sets the JEOC flag as soon as a new injected conversion data is available in one of the ADC\_JDRy register. An interrupt can be generated if bit JEOCIE is set. JEOC flag is cleared by the software either by writing 1 to it or by reading the corresponding ADC\_JDRy register.

The ADC also notifies the end of Sampling phase by setting the status bit EOSMP (for regular conversions only). EOSMP flag is cleared by software by writing 1 to it. An interrupt can be generated if bit EOSMPIE is set.

#### 18.4.24 End of conversion sequence (EOS, JEOS)

The ADC notifies the application for each end of regular sequence (EOS) and for each end of injected sequence (JEOS) event.

The ADC sets the EOS flag as soon as the last data of the regular conversion sequence is available in the ADC\_DR register. An interrupt can be generated if bit EOSIE is set. EOS flag is cleared by the software either by writing 1 to it.

The ADC sets the JEOS flag as soon as the last data of the injected conversion sequence is complete. An interrupt can be generated if bit JEOSIE is set. JEOS flag is cleared by the software either by writing 1 to it.

18.4.25 Timing diagrams example (single/continuous modes, hardware/software triggers)

Figure 92. Single conversions of a sequence, software trigger

1. EXTEN[1:0] = 00, CONT = 0
2. Channels selected = 1,9, 10, 17; AUTDLY = 0.

Figure 93. Continuous conversion of a sequence, software trigger

1. EXTEN[1:0] = 00, CONT = 1
2. Channels selected = 1,9, 10, 17; AUTDLY = 0.

Figure 94. Single conversions of a sequence, hardware trigger

1. TRGX (over-frequency) is selected as trigger source, EXTEN[1:0] = 01, CONT = 0
2. Channels selected = 1, 2, 3, 4; AUTDLY = 0.

Figure 95. Continuous conversions of a sequence, hardware trigger

1. TRGX is selected as trigger source, EXTEN[1:0] = 10, CONT = 1
2. Channels selected = 1, 2, 3, 4; AUTDLY = 0.

## 18.4.26 Data management

### Data register, data alignment and offset (ADC\_DR, OFFSETy, OFFSETy\_CH, ALIGN)

#### Data and alignment

At the end of each regular conversion channel (when EOC event occurs), the result of the converted data is stored into the ADC\_DR data register which is 16 bits wide.

At the end of each injected conversion channel (when JEOC event occurs), the result of the converted data is stored into the corresponding ADC\_JDRy data register which is 16 bits wide.

The ALIGN bit in the ADC\_CFGR register selects the alignment of the data stored after conversion. Data can be right- or left-aligned as shown in [Figure 96](#), [Figure 97](#), [Figure 98](#) and [Figure 99](#).

Special case: when left-aligned, the data are aligned on a half-word basis except when the resolution is set to 6-bit. In that case, the data are aligned on a byte basis as shown in [Figure 98](#) and [Figure 99](#).

**Note:** *Left-alignment is not supported in oversampling mode. When ROVSE and/or JOVSE bit is set, the ALIGN bit value is ignored and the ADC only provides right-aligned data.*

#### Offset

An offset y (y = 1,2,3,4) can be applied to a channel by setting the bit OFFSETy\_EN = 1 into ADC\_OFRy register. The channel to which the offset is applied is programmed into the bits OFFSETy\_CH[4:0] of ADC\_OFRy register. In this case, the converted value is decreased by the user-defined offset written in the bits OFFSETy[11:0]. The result may be a negative value so the read data is signed and the SEXT bit represents the extended sign value.

**Note:** *Offset correction is not supported in oversampling mode. When ROVSE and/or JOVSE bit is set, the value of the OFFSETy\_EN bit in ADC\_OFRy register is ignored (considered as reset).*

[Table 113](#) describes how the comparison is performed for all the possible resolutions for analog watchdog 1.

**Table 111. Offset computation versus data resolution**

| Resolution<br>(bits<br>RES[1:0]) | Subtraction between raw<br>converted data and offset |              | Result                | Comments                                     |
|----------------------------------|------------------------------------------------------|--------------|-----------------------|----------------------------------------------|
|                                  | Raw<br>converted<br>Data, left<br>aligned            | Offset       |                       |                                              |
| 00: 12-bit                       | DATA[11:0]                                           | OFFSET[11:0] | Signed<br>12-bit data | -                                            |
| 01: 10-bit                       | DATA[11:2],00                                        | OFFSET[11:0] | Signed<br>10-bit data | The user must configure OFFSET[1:0]<br>to 00 |

Table 111. Offset computation versus data resolution (continued)

| Resolution<br>(bits<br>RES[1:0]) | Subtraction between raw<br>converted data and offset |              | Result               | Comments                                         |
|----------------------------------|------------------------------------------------------|--------------|----------------------|--------------------------------------------------|
|                                  | Raw<br>converted<br>Data, left<br>aligned            | Offset       |                      |                                                  |
| 10: 8-bit                        | DATA[11:4],00<br>00                                  | OFFSET[11:0] | Signed<br>8-bit data | The user must configure OFFSET[3:0]<br>to 0000   |
| 11: 6-bit                        | DATA[11:6],00<br>0000                                | OFFSET[11:0] | Signed<br>6-bit data | The user must configure OFFSET[5:0]<br>to 000000 |

When reading data from ADC\_DR (regular channel) or from ADC\_JDRy (injected channel, y = 1,2,3,4) corresponding to the channel “i”:

- If one of the offsets is enabled (bit OFFSETy\_EN = 1) for the corresponding channel, the read data is signed.
- If none of the four offsets is enabled for this channel, the read data is not signed.

Figure 96, Figure 97, Figure 98 and Figure 99 show alignments for signed and unsigned data.

Figure 96. Right alignment (offset disabled, unsigned value)

|                    |   |   |   |      |     |    |    |    |    |    |    |      |    |    |    |

MS31015V1

**Figure 97. Right alignment (offset enabled, signed value)****Figure 98. Left alignment (offset disabled, unsigned value)**

**Figure 99. Left alignment (offset enabled, signed value)****ADC overrun (OVR, OVRMOD)**

The overrun flag (OSR) notifies of that a buffer overrun event occurred when the regular converted data has not been read (by the CPU or the DMA) before new converted data became available.

The OVR flag is set if the EOC flag is still 1 at the time when a new conversion completes. An interrupt can be generated if bit OVRIE = 1.

When an overrun condition occurs, the ADC is still operating and can continue converting unless the software decides to stop and reset the sequence by setting bit ADSTP = 1.

OVR flag is cleared by software by writing 1 to it.

It is possible to configure if data is preserved or overwritten when an overrun event occurs by programming the control bit OVRMOD:

- OVRMOD = 0: The overrun event preserves the data register from being overrun: the old data is maintained and the new conversion is discarded and lost. If OVR remains at 1, any further conversions occur but the result data is also discarded.
- OVRMOD = 1: The data register is overwritten with the last conversion result and the previous unread data is lost. If OVR remains at 1, any further conversions operate normally and the ADC\_DR register always contains the latest converted data.

Figure 100. Example of overrun (OVR)

**Note:** There is no overrun detection on the injected channels since there is a dedicated data register for each of the four injected channels.

### Managing a sequence of conversions without using the DMA

If the conversions are slow enough, the conversion sequence can be handled by the software. In this case the software must use the EOC flag and its associated interrupt to handle each data. Each time a conversion is complete, EOC is set and the ADC\_DR register can be read. OVRMOD should be configured to 0 to manage overrun events as an error.

### Managing conversions without using the DMA and without overrun

It may be useful to let the ADC convert one or more channels without reading the data each time (if there is an analog watchdog for instance). In this case, the OVRMOD bit must be configured to 1 and OVR flag should be ignored by the software. An overrun event does not prevent the ADC from continuing to convert and the ADC\_DR register always contains the latest conversion.

### Managing conversions using the DMA

Since converted channel values are stored into a unique data register, it is useful to use DMA for conversion of more than one channel. This avoids the loss of the data already stored in the ADC\_DR register.

When the DMA mode is enabled (DMAEN bit set in the ADC\_CFGR register in single ADC mode or MDMA different from 00 in dual ADC mode), a DMA request is generated after each conversion of a channel. This allows the transfer of the converted data from the ADC\_DR register to the destination location selected by the software.

Despite this, if an overrun occurs ( $OVR = 1$ ) because the DMA could not serve the DMA transfer request in time, the ADC stops generating DMA requests and the data corresponding to the new conversion is not transferred by the DMA. Which means that all the data transferred to the RAM can be considered as valid.

Depending on the configuration of  $OVRMOD$  bit, the data is either preserved or overwritten (refer to [Section : ADC overrun \(OVR, OVRMOD\)](#)).

The DMA transfer requests are blocked until the software clears the  $OVR$  bit.

Two different DMA modes are proposed depending on the application use and are configured with bit  $DMACFG$  of the  $ADC\_CFGR$  register in single ADC mode, or with bit  $DMACFG$  of the  $ADC\_CCR$  register in dual ADC mode:

- DMA one shot mode ( $DMACFG = 0$ ).  
This mode is suitable when the DMA is programmed to transfer a fixed number of data.
- DMA circular mode ( $DMACFG = 1$ )  
This mode is suitable when programming the DMA in circular mode.

#### **DMA one shot mode ( $DMACFG = 0$ )**

In this mode, the ADC generates a DMA transfer request each time a new conversion data is available and stops generating DMA requests once the DMA has reached the last DMA transfer (when a transfer complete interrupt occurs - refer to DMA section) even if a conversion has been started again.

When the DMA transfer is complete (all the transfers configured in the DMA controller have been done):

- The content of the ADC data register is frozen.
- Any ongoing conversion is aborted with partial result discarded.
- No new DMA request is issued to the DMA controller. This avoids generating an overrun error if there are still conversions which are started.
- Scan sequence is stopped and reset.
- The DMA is stopped.

#### **DMA circular mode ( $DMACFG = 1$ )**

In this mode, the ADC generates a DMA transfer request each time a new conversion data is available in the data register, even if the DMA has reached the last DMA transfer. This allows configuring the DMA in circular mode to handle a continuous analog input data stream.

### **18.4.27 Managing conversions using the DFSDM**

The ADC conversion results can be transferred directly to the Digital filter for sigma delta modulators (DFSDM).

In this case, the  $DFSDMCFG$  bit must be set and  $DMAEN$  bit must be cleared.

The ADC transfers all the 16 bits of the regular data register to the DFSDM and resets the EOC flag once the transfer is complete.

The data format must be 16-bit signed:

ADC\_DR[15:12] = sign extended

ADC\_DR[11] = sign

ADC\_DR[11:0] = data

To obtain 16-bit signed format in 12-bit ADC mode, the software needs to configure the OFFSETy[11:0] to 0x800 after having set OFFSETy\_EN to 1.

Only right aligned data format is available for the DFSDM interface (see [Figure 97: Right alignment \(offset enabled, signed value\)](#)).

## 18.4.28 Dynamic low-power features

### Auto-delayed conversion mode (AUTDLY)

The ADC implements an auto-delayed conversion mode controlled by the AUTDLY configuration bit. Auto-delayed conversions are useful to simplify the software as well as to optimize performance of an application clocked at low frequency where there would be risk of encountering an ADC overrun.

When AUTDLY = 1, a new conversion can start only if all the previous data of the same group has been treated:

- For a regular conversion: once the ADC\_DR register has been read or if the EOC bit has been cleared (see [Figure 101](#)).
- For an injected conversion: when the JEOS bit has been cleared (see [Figure 102](#)).

This is a way to automatically adapt the speed of the ADC to the speed of the system which reads the data.

The delay is inserted after each regular conversion (whatever DISCEN = 0 or 1) and after each sequence of injected conversions (whatever JDISCEN = 0 or 1).

*Note:* There is no delay inserted between each conversions of the injected sequence, except after the last one.

During a conversion, a hardware trigger event (for the same group of conversions) occurring during this delay is ignored.

*Note:* This is not true for software triggers where it remains possible during this delay to set the bits ADSTART or JADSTART to restart a conversion: it is up to the software to read the data before launching a new conversion.

No delay is inserted between conversions of different groups (a regular conversion followed by an injected conversion or conversely):

- If an injected trigger occurs during the automatic delay of a regular conversion, the injected conversion starts immediately (see [Figure 102](#)).
- Once the injected sequence is complete, the ADC waits for the delay (if not ended) of the previous regular conversion before launching a new regular conversion (see [Figure 104](#)).

The behavior is slightly different in auto-injected mode (JAUTO = 1) where a new regular conversion can start only when the automatic delay of the previous injected sequence of conversion has ended (when JEOS has been cleared). This is to ensure that the software can read all the data of a given sequence before starting a new sequence (see [Figure 105](#)).

To stop a conversion in continuous auto-injection mode combined with autodelay mode (JAUTO = 1, CONT = 1 and AUTDLY = 1), follow the following procedure:

1. Wait until JEOS = 1 (no more conversions are restarted)
2. Clear JEOS.
3. Set ADSTP.
4. Read the regular data.

If this procedure is not respected, a new regular sequence can restart if JEOS is cleared after ADSTP has been set.

In AUTDLY mode, a hardware regular trigger event is ignored if it occurs during an already ongoing regular sequence or during the delay that follows the last regular conversion of the sequence. It is however considered pending if it occurs after this delay, even if it occurs during an injected sequence or the delay that follows it. The conversion then starts at the end of the delay of the injected sequence.

In AUTDLY mode, a hardware injected trigger event is ignored if it occurs during an already ongoing injected sequence or during the delay that follows the last injected conversion of the sequence.

**Figure 101. AUTODLY = 1, regular conversion in continuous mode, software trigger**

### 18.4.29 Analog window watchdog (AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\_HTx, AWD\_LTx, AWDx)

The three AWD analog watchdogs monitor whether some channels remain within a configured voltage range (window).

**Figure 106. Analog watchdog guarded area**

#### AWDx flag and interrupt

An interrupt can be enabled for each of the 3 analog watchdogs by setting AWDxIE in the ADC\_IER register (x = 1,2,3).

AWDx (x = 1,2,3) flag is cleared by software by writing 1 to it.

The ADC conversion result is compared to the lower and higher thresholds before alignment.

#### Description of analog watchdog 1

The AWD analog watchdog 1 is enabled by setting the AWD1EN bit in the ADC\_CFGR register. This watchdog monitors whether either one selected channel or all enabled channels<sup>(1)</sup> remain within a configured voltage range (window).

[Table 112](#) shows how the ADC\_CFGR registers should be configured to enable the analog watchdog on one or more channels.

**Table 112. Analog watchdog channel selection**

| Channels guarded by the analog watchdog           | AWD1SGL bit | AWD1EN bit | JAWD1EN bit |
|---------------------------------------------------|-------------|------------|-------------|
| None                                              | x           | 0          | 0           |
| All injected channels                             | 0           | 0          | 1           |
| All regular channels                              | 0           | 1          | 0           |
| All regular and injected channels                 | 0           | 1          | 1           |
| Single <sup>(1)</sup> injected channel            | 1           | 0          | 1           |
| Single <sup>(1)</sup> regular channel             | 1           | 1          | 0           |
| Single <sup>(1)</sup> regular or injected channel | 1           | 1          | 1           |

1. Selected by the AWD1CH[4:0] bits. The channels must also be programmed to be converted in the appropriate regular or injected sequence.

The AWD1 analog watchdog status bit is set if the analog voltage converted by the ADC is below a lower threshold or above a higher threshold.

These thresholds are programmed in bits HT1[11:0] and LT1[11:0] of the ADC\_TR1 register for the analog watchdog 1. When converting data with a resolution of less than 12 bits (according to bits RES[1:0]), the LSB of the programmed thresholds must be kept cleared because the internal comparison is always performed on the full 12-bit raw converted data (left aligned).

[Table 113](#) describes how the comparison is performed for all the possible resolutions for analog watchdog 1.

**Table 113. Analog watchdog 1 comparison**

| Resolution(<br>bit<br>RES[1:0]) | Analog watchdog comparison<br>between: |                         | Comments                                            |
|---------------------------------|----------------------------------------|-------------------------|-----------------------------------------------------|
|                                 | Raw converted data,<br>left aligned    | Thresholds              |                                                     |
| 00: 12-bit                      | DATA[11:0]                             | LT1[11:0] and HT1[11:0] | -                                                   |
| 01: 10-bit                      | DATA[11:2],00                          | LT1[11:0] and HT1[11:0] | User must configure LT1[1:0] and HT1[1:0] to 00     |
| 10: 8-bit                       | DATA[11:4],0000                        | LT1[11:0] and HT1[11:0] | User must configure LT1[3:0] and HT1[3:0] to 0000   |
| 11: 6-bit                       | DATA[11:6],000000                      | LT1[11:0] and HT1[11:0] | User must configure LT1[5:0] and HT1[5:0] to 000000 |

### Description of analog watchdog 2 and 3

The second and third analog watchdogs are more flexible and can guard several selected channels by programming the corresponding bits in AWDxCH[18:0] (x=2,3).

The corresponding watchdog is enabled when any bit of AWDxCH[18:0] (x=2,3) is set.

They are limited to a resolution of 8 bits and only the 8 MSBs of the thresholds can be programmed into HTx[7:0] and LTx[7:0]. [Table 114](#) describes how the comparison is performed for all the possible resolutions.

**Table 114. Analog watchdog 2 and 3 comparison**

| Resolution<br>(bits RES[1:0]) | Analog watchdog comparison between: |                       | Comments                                        |
|-------------------------------|-------------------------------------|-----------------------|-------------------------------------------------|
|                               | Raw converted data,<br>left aligned | Thresholds            |                                                 |
| 00: 12-bit                    | DATA[11:4]                          | LTx[7:0] and HTx[7:0] | DATA[3:0] are not relevant for the comparison   |
| 01: 10-bit                    | DATA[11:4]                          | LTx[7:0] and HTx[7:0] | DATA[3:2] are not relevant for the comparison   |
| 10: 8-bit                     | DATA[11:4]                          | LTx[7:0] and HTx[7:0] | -                                               |
| 11: 6-bit                     | DATA[11:6],00                       | LTx[7:0] and HTx[7:0] | User must configure LTx[1:0] and HTx[1:0] to 00 |

### ADCy\_AWDx\_OUT signal output generation

Each analog watchdog is associated to an internal hardware signal ADCy\_AWDx\_OUT (y=ADC number, x=watchdog number) which is directly connected to the ETR input (external trigger) of some on-chip timers. Refer to the on-chip timers section to understand how to select the ADCy\_AWDx\_OUT signal as ETR.

ADCy\_AWDx\_OUT is activated when the associated analog watchdog is enabled:

- ADCy\_AWDx\_OUT is set when a guarded conversion is outside the programmed thresholds.
- ADCy\_AWDx\_OUT is reset after the end of the next guarded conversion which is inside the programmed thresholds (It remains at 1 if the next guarded conversions are still outside the programmed thresholds).
- ADCy\_AWDx\_OUT is also reset when disabling the ADC (when setting ADDIS = 1). Note that stopping regular or injected conversions (setting ADSTP = 1 or JADSTP = 1) has no influence on the generation of ADCy\_AWDx\_OUT.

**Note:** *AWDx flag is set by hardware and reset by software: AWDx flag has no influence on the generation of ADCy\_AWDx\_OUT (ex: ADCy\_AWDx\_OUT can toggle while AWDx flag remains at 1 if the software did not clear the flag).*

**Figure 107. ADCy\_AWDx\_OUT signal generation (on all regular channels)**

### 18.4.30 Oversampler

The oversampling unit performs data pre-processing to offload the CPU. It is able to handle multiple conversions and average them into a single data with increased data width, up to 16-bit.

It provides a result with the following form, where N and M can be adjusted:

$$\text{Result} = \frac{1}{M} \times \sum_{n=0}^{n=N-1} \text{Conversion}(t_n)$$

It allows to perform by hardware the following functions: averaging, data rate reduction, SNR improvement, basic filtering.

The oversampling ratio N is defined using the OVFS[2:0] bits in the ADC\_CFGR2 register, and can range from 2x to 256x. The division coefficient M consists of a right bit shift up to 8 bits, and is defined using the OVSS[3:0] bits in the ADC\_CFGR2 register.

The summation unit can yield a result up to 20 bits (256x 12-bit results), which is first shifted right. It is then truncated to the 16 least significant bits, rounded to the nearest value using the least significant bits left apart by the shifting, before being finally transferred into the ADC\_DR data register.

*Note: If the intermediary result after the shifting exceeds 16-bit, the result is truncated as is, without saturation.*

**Figure 111. 20-bit to 16-bit result truncation**

Figure 112 gives a numerical example of the processing, from a raw 20-bit accumulated data to the final 16-bit result.

**Figure 112. Numerical example with 5-bit shift and rounding**

Table 115 gives the data format for the various N and M combinations, for a raw conversion data equal to 0xFFFF.

Table 115. Maximum output results versus N and M (gray cells indicate truncation)

| Over sampling ratio | Max Raw data | No-shift<br>OVSS = 0000 | 1-bit shift<br>OVSS = 0001 | 2-bit shift<br>OVSS = 0010 | 3-bit shift<br>OVSS = 0011 | 4-bit shift<br>OVSS = 0100 | 5-bit shift<br>OVSS = 0101 | 6-bit shift<br>OVSS = 0110 | 7-bit shift<br>OVSS = 0111 | 8-bit shift<br>OVSS = 1000 |
|---------------------|--------------|-------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|

| 128x                | 0x7FF80      | 0xFF80                  | 0xFFC0                     | 0xFFE0                     | 0xFFF0                     | 0x7FF8                     | 0x3FFC                     | 0x1FFE                     | 0x0FFF                     | 0x0800                     |
| 256x                | 0xFFF00      | 0xFF00                  | 0xFF80                     | 0xFFC0                     | 0xFFE0                     | 0xFFF0                     | 0x7FF8                     | 0x3FFC                     | 0x1FFE                     | 0x0FFF                     |

There are no changes for conversion timings in oversampled mode: the sample time is maintained equal during the whole oversampling sequence. A new data is provided every N conversions, with an equivalent delay equal to  $N \times T_{\text{CONV}} = N \times (t_{\text{SMPL}} + t_{\text{SAR}})$ . The flags are set as follows:

- The end of the sampling phase (EOSMP) is set after each sampling phase
- The end of conversion (EOC) occurs once every N conversions, when the oversampled result is available
- The end of sequence (EOS) occurs once the sequence of oversampled data is completed (i.e. after N x sequence length conversions total)

### ADC operating modes supported when oversampling (single ADC mode)

In oversampling mode, most of the ADC operating modes are maintained:

- Single or continuous mode conversions
- ADC conversions start either by software or with triggers
- ADC stop during a conversion (abort)
- Data read via CPU or DMA with overrun detection
- Low-power modes (AUTDLY)
- Programmable resolution: in this case, the reduced conversion values (as per RES[1:0] bits in ADC\_CFGR1 register) are accumulated, truncated, rounded and shifted in the same way as 12-bit conversions are

**Note:** The alignment mode is not available when working with oversampled data. The ALIGN bit in ADC\_CFGR1 is ignored and the data are always provided right-aligned.

Offset correction is not supported in oversampling mode. When ROVSE and/or JOVSE bit is set, the value of the OFFSETy\_EN bit in ADC\_OFRy register is ignored (considered as reset).

### Analog watchdog

The analog watchdog functionality is maintained, with the following difference:

- The RES[1:0] bits are ignored, comparison is always done using the full 12-bit values HT[11:0] and LT[11:0]
- the comparison is performed on the most significant 12-bit of the 16-bit oversampled results ADC\_DR[15:4]

*Note:*

*Care must be taken when using high shifting values, since this reduces the comparison range. For instance, if the oversampled result is shifted by 4 bits, thus yielding a 12-bit data right-aligned, the effective analog watchdog comparison can only be performed on 8 bits. The comparison is done between ADC\_DR[11:4] and HT[0:7] / LT[0:7], and HT[11:8] / LT[11:8] must be kept reset.*

### Triggered mode

The averager can also be used for basic filtering purpose. Although not a very powerful filter (slow roll-off and limited stop band attenuation), it can be used as a notch filter to reject constant parasitic frequencies (typically coming from the mains or from a switched mode power supply). For this purpose, a specific discontinuous mode can be enabled with TROVS bit in ADC\_CFGR2, to be able to have an oversampling frequency defined by a user and independent from the conversion time itself.

Figure 113 below shows how conversions are started in response to triggers during discontinuous mode.

If the TROVS bit is set, the content of the DISCEN bit is ignored and considered as 1.

**Figure 113. Triggered regular oversampling mode (TROVS bit = 1)**

### Injected and regular sequencer management when oversampling

In oversampling mode, it is possible to have differentiated behavior for injected and regular sequencers. The oversampling can be enabled for both sequencers with some limitations if they have to be used simultaneously (this is related to a unique accumulation unit).

### Oversampling regular channels only

The regular oversampling mode bit ROVSM defines how the regular oversampling sequence is resumed if it is interrupted by injected conversion:

- In continued mode, the accumulation restarts from the last valid data (prior to the conversion abort request due to the injected trigger). This ensures that oversampling is complete whatever the injection frequency (providing at least one regular conversion can be complete between triggers);
- In resumed mode, the accumulation restarts from 0 (previous conversion results are ignored). This mode allows to guarantee that all data used for oversampling were converted back-to-back within a single timeslot. Care must be taken to have a injection trigger period above the oversampling period length. If this condition is not respected, the oversampling cannot be complete and the regular sequencer is blocked.

Figure 114 gives examples for a 4x oversampling ratio.

**Figure 114. Regular oversampling modes (4x ratio)**

### Oversampling Injected channels only

The Injected oversampling mode bit JOVSE enables oversampling solely for conversions in the injected sequencer.

### Oversampling regular and Injected channels

It is possible to have both ROVSE and JOVSE bits set. In this case, the regular oversampling mode is forced to resumed mode (ROVSM bit ignored), as represented on [Figure 115](#) below.

**Figure 115. Regular and injected oversampling modes used simultaneously**

### Triggered regular oversampling with injected conversions

It is possible to have triggered regular mode with injected conversions. In this case, the injected mode oversampling mode must be disabled, and the ROVSM bit is ignored (resumed mode is forced). The JOVSE bit must be reset. The behavior is represented on [Figure 116](#) below.

**Figure 116. Triggered regular oversampling with injection**

### Auto-injected mode

It is possible to oversample auto-injected sequences and have all conversions results stored in registers to save a DMA resource. This mode is available only with both regular and injected oversampling active: JAUTO = 1, ROVSE = 1 and JOVSE = 1, other combinations are not supported. The ROVSM bit is ignored in auto-injected mode. The [Figure 117](#) below shows how the conversions are sequenced.

**Figure 117. Oversampling in auto-injected mode**

It is possible to have also the triggered mode enabled, using the TROVS bit. In this case, the ADC must be configured as following: JAUTO = 1, DISCEN = 0, JDISCEN = 0, ROVSE = 1, JOVSE = 1 and TROVSE = 1.

### Dual ADC modes supported when oversampling

It is possible to have oversampling enabled when working in dual ADC configuration, for the injected simultaneous mode and regular simultaneous mode. In this case, the two ADCs must be programmed with the very same settings (including oversampling).

All other dual ADC modes are not supported when either regular or injected oversampling is enabled (ROVSE = 1 or JOVSE = 1).

### Combined modes summary

The [Table 116](#) below summarizes all combinations, including modes not supported.

**Table 116. Oversampler operating modes summary**

| Regular Oversampling<br>ROVSE | Injected Oversampling<br>JOVSE | Oversampler mode<br>ROVSM<br>0 = continued<br>1 = resumed | Triggered Regular mode<br>TROVS | Comment                           |
|-------------------------------|--------------------------------|-----------------------------------------------------------|---------------------------------|-----------------------------------|
| 1                             | 0                              | 0                                                         | 0                               | Regular continued mode            |
| 1                             | 0                              | 0                                                         | 1                               | Not supported                     |
| 1                             | 0                              | 1                                                         | 0                               | Regular resumed mode              |
| 1                             | 0                              | 1                                                         | 1                               | Triggered regular resumed mode    |
| 1                             | 1                              | 0                                                         | X                               | Not supported                     |
| 1                             | 1                              | 1                                                         | 0                               | Injected and regular resumed mode |
| 1                             | 1                              | 1                                                         | 1                               | Not supported                     |
| 0                             | 1                              | X                                                         | X                               | Injected oversampling             |

### 18.4.31 Dual ADC modes

Dual ADC modes can be used in devices with two ADCs or more (see [Figure 118](#)).

In dual ADC mode the start of conversion is triggered alternately or simultaneously by the ADCx master to the ADC slave, depending on the mode selected by the bits DUAL[4:0] in the ADCx\_CCR register.

Four possible modes are implemented:

- Injected simultaneous mode
- Regular simultaneous mode
- Interleaved mode
- Alternate trigger mode

It is also possible to use these modes combined in the following ways:

- Injected simultaneous mode + Regular simultaneous mode
- Regular simultaneous mode + Alternate trigger mode
- Injected simultaneous mode + Interleaved mode

In dual ADC mode (when bits DUAL[4:0] in ADCx\_CCR register are not equal to zero), the bits CONT, AUTDLY, DISCEN, DISCNUM[2:0], JDISCEN, JQM, JAUTO of the ADC\_CFGR register are shared between the master and slave ADC: the bits in the slave ADC are always equal to the corresponding bits of the master ADC.

To start a conversion in dual mode, the user must program the bits EXTEN[1:0], EXTSEL, JEXTEN[1:0], JEXTSEL of the master ADC only, to configure a software or hardware trigger, and a regular or injected trigger. (the bits EXTEN[1:0] and JEXTEN[1:0] of the slave ADC are don't care).

In regular simultaneous or interleaved modes: once the user sets bit ADSTART or bit ADSTP of the master ADC, the corresponding bit of the slave ADC is also automatically set. However, bit ADSTART or bit ADSTP of the slave ADC is not necessary cleared at the same time as the master ADC bit.

In injected simultaneous or alternate trigger modes: once the user sets bit JADSTART or bit JADSTP of the master ADC, the corresponding bit of the slave ADC is also automatically set. However, bit JADSTART or bit JADSTP of the slave ADC is not necessary cleared at the same time as the master ADC bit.

In dual ADC mode, the converted data of the master and slave ADC can be read in parallel, by reading the ADC common data register (ADCx\_CDR). The status bits can be also read in parallel by reading the dual-mode status register (ADCx\_CSR).

Figure 118. Dual ADC block diagram<sup>(1)</sup>

1. External triggers also exist on slave ADC but are not shown for the purposes of this diagram.
2. The ADC common data register (ADCx\_CDR) contains both the master and slave ADC regular converted data.

### Injected simultaneous mode

This mode is selected by programming bits DUAL[4:0] = 00101

This mode converts an injected group of channels. The external trigger source comes from the injected group multiplexer of the master ADC (selected by the JEXTSEL bits in the ADC\_JSQR register).

**Note:** *Do not convert the same channel on the two ADCs (no overlapping sampling times for the two ADCs when converting the same channel).*

*In simultaneous mode, one must convert sequences with the same length or ensure that the interval between triggers is longer than the longer of the 2 sequences. Otherwise, the ADC with the shortest sequence may restart while the ADC with the longest sequence is completing the previous conversions.*

*Regular conversions can be performed on one or all ADCs. In that case, they are independent of each other and are interrupted when an injected event occurs. They are resumed at the end of the injected conversion group.*

- At the end of injected sequence of conversion event (JEOS) on the master ADC, the converted data is stored into the master ADC\_JDRy registers and a JEOS interrupt is generated (if enabled)
- At the end of injected sequence of conversion event (JEOS) on the slave ADC, the converted data is stored into the slave ADC\_JDRy registers and a JEOS interrupt is generated (if enabled)
- If the duration of the master injected sequence is equal to the duration of the slave injected one (like in [Figure 119](#)), it is possible for the software to enable only one of the two JEOS interrupt (ex: master JEOS) and read both converted data (from master ADC\_JDRy and slave ADC\_JDRy registers).

**Figure 119. Injected simultaneous mode on 4 channels: dual ADC mode**

If JDISCEN = 1, each simultaneous conversion of the injected sequence requires an injected trigger event to occur.

This mode can be combined with AUTDLY mode:

- Once a simultaneous injected sequence of conversions has ended, a new injected trigger event is accepted only if both JEOS bits of the master and the slave ADC have been cleared (delay phase). Any new injected trigger events occurring during the ongoing injected sequence and the associated delay phase are ignored.
- Once a regular sequence of conversions of the master ADC has ended, a new regular trigger event of the master ADC is accepted only if the master data register (ADC\_DR) has been read. Any new regular trigger events occurring for the master ADC during the

ongoing regular sequence and the associated delay phases are ignored.  
There is the same behavior for regular sequences occurring on the slave ADC.

### Regular simultaneous mode with independent injected

This mode is selected by programming bits DUAL[4:0] = 00110.

This mode is performed on a regular group of channels. The external trigger source comes from the regular group multiplexer of the master ADC (selected by the EXTSEL bits in the ADC\_CFGR register). A simultaneous trigger is provided to the slave ADC.

In this mode, independent injected conversions are supported. An injection request (either on master or on the slave) aborts the current simultaneous conversions, which are restarted once the injected conversion is completed.

**Note:** *Do not convert the same channel on the two ADCs (no overlapping sampling times for the two ADCs when converting the same channel).*

*In regular simultaneous mode, one must convert sequences with the same length or ensure that the interval between triggers is longer than the longer conversion time of the 2 sequences. Otherwise, the ADC with the shortest sequence may restart while the ADC with the longest sequence is completing the previous conversions.*

Software is notified by interrupts when it can read the data:

- At the end of each conversion event (EOC) on the master ADC, a master EOC interrupt is generated (if EOCIE is enabled) and software can read the ADC\_DR of the master ADC.
- At the end of each conversion event (EOC) on the slave ADC, a slave EOC interrupt is generated (if EOCIE is enabled) and software can read the ADC\_DR of the slave ADC.
- If the duration of the master regular sequence is equal to the duration of the slave one (like in [Figure 120](#)), it is possible for the software to enable only one of the two EOC interrupt (ex: master EOC) and read both converted data from the Common Data register (ADCx\_CDR).

It is also possible to read the regular data using the DMA. Two methods are possible:

- Using two DMA channels (one for the master and one for the slave). In this case bits MDMA[1:0] must be kept cleared.
  - Configure the DMA master ADC channel to read ADC\_DR from the master. DMA requests are generated at each EOC event of the master ADC.
  - Configure the DMA slave ADC channel to read ADC\_DR from the slave. DMA requests are generated at each EOC event of the slave ADC.
- Using MDMA mode, which leaves one DMA channel free for other uses:
  - Configure MDMA[1:0] = 10 or 11 (depending on resolution).
  - A single DMA channel is used (the one of the master). Configure the DMA master ADC channel to read the common ADC register (ADCx\_CDR)
  - A single DMA request is generated each time both master and slave EOC events have occurred. At that time, the slave ADC converted data is available in the upper half-word of the ADCx\_CDR 32-bit register and the master ADC converted data is available in the lower half-word of ADCx\_CDR register.
  - Both EOC flags are cleared when the DMA reads the ADCx\_CDR register.

**Note:** *In MDMA mode (MDMA[1:0] = 10 or 11), the user must program the same number of conversions in the master's sequence as in the slave's sequence. Otherwise, the remaining conversions does not generate a DMA request.*

**Figure 120. Regular simultaneous mode on 16 channels: dual ADC mode**

If DISCEN = 1 then each “n” simultaneous conversions of the regular sequence require a regular trigger event to occur (“n” is defined by DISCNUM).

This mode can be combined with AUTDLY mode:

- Once a simultaneous conversion of the sequence has ended, the next conversion in the sequence is started only if the common data register, ADCx\_CDR (or the regular data register of the master ADC) has been read (delay phase).
- Once a simultaneous regular sequence of conversions has ended, a new regular trigger event is accepted only if the common data register (ADCx\_CDR) has been read (delay phase). Any new regular trigger events occurring during the ongoing regular sequence and the associated delay phases are ignored.

It is possible to use the DMA to handle data in regular simultaneous mode combined with AUTDLY mode, assuming that multiple-DMA mode is used: bits MDMA must be set to 10 or 11.

When regular simultaneous mode is combined with AUTDLY mode, it is mandatory for the user to ensure that:

- The number of conversions in the master’s sequence is equal to the number of conversions in the slave’s.
- For each simultaneous conversions of the sequence, the length of the conversion of the slave ADC is inferior to the length of the conversion of the master ADC. Note that the length of the sequence depends on the number of channels to convert and the sampling time and the resolution of each channels.

**Note:** *This combination of regular simultaneous mode and AUTDLY mode is restricted to the use case when only regular channels are programmed: it is forbidden to program injected channels in this combined mode.*

### Interleaved mode with independent injected

This mode is selected by programming bits DUAL[4:0] = 00111.

This mode can be started only on a regular group (usually one channel). The external trigger source comes from the regular channel multiplexer of the master ADC.

After an external trigger occurs:

- The master ADC starts immediately.
- The slave ADC starts after a delay of several-ADC clock cycles after the sampling phase of the master ADC has complete.

The minimum delay which separates two conversions in interleaved mode is configured in the DELAY bits in the ADCx\_CCR register. This delay starts counting one half cycle after the end of the sampling phase of the master conversion. This way, an ADC cannot start a

conversion if the complementary ADC is still sampling its input (only one ADC can sample the input signal at a given time).

- The minimum possible DELAY is 1 to ensure that there is at least one cycle time between the opening of the analog switch of the master ADC sampling phase and the closing of the analog switch of the slave ADC sampling phase.
- The maximum DELAY is equal to the number of cycles corresponding to the selected resolution. However the user must properly calculate this delay to ensure that an ADC does not start a conversion while the other ADC is still sampling its input.

If the CONT bit is set on both master and slave ADCs, the selected regular channels of both ADCs are continuously converted.

The software is notified by interrupts when it can read the data at the end of each conversion event (EOC) on the slave ADC. A slave and master EOC interrupts are generated (if EOCIE is enabled) and the software can read the ADC\_DR of the slave/master ADC.

**Note:** *It is possible to enable only the EOC interrupt of the slave and read the common data register (ADCx\_CDR). But in this case, the user must ensure that the duration of the conversions are compatible to ensure that inside the sequence, a master conversion is always followed by a slave conversion before a new master conversion restarts. It is recommended to use the MDMA mode.*

It is also possible to have the regular data transferred by DMA. In this case, individual DMA requests on each ADC cannot be used and it is mandatory to use the MDMA mode, as following:

- Configure MDMA[1:0] = 10 or 11 (depending on resolution).
- A single DMA channel is used (the one of the master). Configure the DMA master ADC channel to read the common ADC register (ADCx\_CDR).
- A single DMA request is generated each time both master and slave EOC events have occurred. At that time, the slave ADC converted data is available in the upper half-word of the ADCx\_CDR 32-bit register and the master ADC converted data is available in the lower half-word of ADCx\_CCR register.
- Both EOC flags are cleared when the DMA reads the ADCx\_CCR register.

**Figure 121. Interleaved mode on 1 channel in continuous conversion mode: dual ADC mode**

**Figure 122. Interleaved mode on 1 channel in single conversion mode: dual ADC mode**

If DISCEN = 1, each “n” simultaneous conversions (“n” is defined by DISCNUM) of the regular sequence require a regular trigger event to occur.

In this mode, injected conversions are supported. When injection is done (either on master or on slave), both the master and the slave regular conversions are aborted and the sequence is restarted from the master (see [Figure 123](#) below).

**Figure 123. Interleaved conversion with injection**

### Alternate trigger mode

This mode is selected by programming bits DUAL[4:0] = 01001.

This mode can be started only on an injected group. The source of external trigger comes from the injected group multiplexer of the master ADC.

This mode is only possible when selecting hardware triggers: JEXTEN[1:0] must not be 00.

**Injected discontinuous mode disabled (JDISCEN = 0 for both ADC)**

1. When the 1st trigger occurs, all injected master ADC channels in the group are converted.
2. When the 2nd trigger occurs, all injected slave ADC channels in the group are converted.
3. And so on.

A JEOS interrupt, if enabled, is generated after all injected channels of the master ADC in the group have been converted.

A JEOS interrupt, if enabled, is generated after all injected channels of the slave ADC in the group have been converted.

JEOC interrupts, if enabled, can also be generated after each injected conversion.

If another external trigger occurs after all injected channels in the group have been converted then the alternate trigger process restarts by converting the injected channels of the master ADC in the group.

**Figure 124. Alternate trigger: injected group of each ADC**

**Note:** Regular conversions can be enabled on one or all ADCs. In this case the regular conversions are independent of each other. A regular conversion is interrupted when the ADC has to perform an injected conversion. It is resumed when the injected conversion is finished.

The time interval between 2 trigger events must be greater than or equal to 1 ADC clock period. The minimum time interval between 2 trigger events that start conversions on the same ADC is the same as in the single ADC mode.

**Injected discontinuous mode enabled (JDISCEN = 1 for both ADC)**

If the injected discontinuous mode is enabled for both master and slave ADCs:

- When the 1st trigger occurs, the first injected channel of the master ADC is converted.
- When the 2nd trigger occurs, the first injected channel of the slave ADC is converted.
- And so on.

A JEOS interrupt, if enabled, is generated after all injected channels of the master ADC in the group have been converted.

A JEOS interrupt, if enabled, is generated after all injected channels of the slave ADC in the group have been converted.

JEOC interrupts, if enabled, can also be generated after each injected conversions.

If another external trigger occurs after all injected channels in the group have been converted then the alternate trigger process restarts.

**Figure 125. Alternate trigger: 4 injected channels (each ADC) in discontinuous mode**

### Combined regular/injected simultaneous mode

This mode is selected by programming bits DUAL[4:0] = 00001.

It is possible to interrupt the simultaneous conversion of a regular group to start the simultaneous conversion of an injected group.

**Note:** *In combined regular/injected simultaneous mode, one must convert sequences with the same length or ensure that the interval between triggers is longer than the long conversion time of the 2 sequences. Otherwise, the ADC with the shortest sequence may restart while the ADC with the longest sequence is completing the previous conversions.*

### Combined regular simultaneous + alternate trigger mode

This mode is selected by programming bits DUAL[4:0] = 00010.

It is possible to interrupt the simultaneous conversion of a regular group to start the alternate trigger conversion of an injected group. [Figure 126](#) shows the behavior of an alternate trigger interrupting a simultaneous regular conversion.

The injected alternate conversion is immediately started after the injected event. If a regular conversion is already running, in order to ensure synchronization after the injected conversion, the regular conversion of all (master/slave) ADCs is stopped and resumed synchronously at the end of the injected conversion.

**Note:** In combined regular simultaneous + alternate trigger mode, one must convert sequences with the same length or ensure that the interval between triggers is longer than the long conversion time of the 2 sequences. Otherwise, the ADC with the shortest sequence may restart while the ADC with the longest sequence is completing the previous conversions.

**Figure 126. Alternate + regular simultaneous**

If a trigger occurs during an injected conversion that has interrupted a regular conversion, the alternate trigger is served. [Figure 127](#) shows the behavior in this case (note that the 6th trigger is ignored because the associated alternate conversion is not complete).

**Figure 127. Case of trigger occurring during injected conversion**

### Combined injected simultaneous plus interleaved

This mode is selected by programming bits DUAL[4:0] = 00011

It is possible to interrupt an interleaved conversion with a simultaneous injected event.

In this case the interleaved conversion is interrupted immediately and the simultaneous injected conversion starts. At the end of the injected sequence the interleaved conversion is resumed. When the interleaved regular conversion resumes, the first regular conversion which is performed is always the master's one. [Figure 128](#), [Figure 129](#) and [Figure 130](#) show the behavior using an example.

**Caution:** In this mode, it is mandatory to use the Common Data Register to read the regular data with a single read access. On the contrary, master-slave data coherency is not guaranteed.

**Figure 128. Interleaved single channel CH0 with injected sequence CH11, CH12**

**Figure 129. Two Interleaved channels (CH1, CH2) with injected sequence CH11, CH12 - case 1: Master interrupted first**

**Figure 130. Two Interleaved channels (CH1, CH2) with injected sequence CH11, CH12 - case 2: Slave interrupted first**

### DMA requests in dual ADC mode

In all dual ADC modes, it is possible to use two DMA channels (one for the master, one for the slave) to transfer the data, like in single mode (refer to [Figure 131: DMA Requests in regular simultaneous mode when MDMA = 00](#)).

**Figure 131. DMA Requests in regular simultaneous mode when MDMA = 00**

In simultaneous regular and interleaved modes, it is also possible to save one DMA channel and transfer both data using a single DMA channel. For this MDMA bits must be configured in the ADCx\_CCR register:

- MDMA = 10:** A single DMA request is generated each time both master and slave EOC events have occurred. At that time, two data items are available and the 32-bit register ADCx\_CDR contains the two half-words representing two ADC-converted data items. The slave ADC data take the upper half-word and the master ADC data take the lower half-word.  
 This mode is used in interleaved mode and in regular simultaneous mode when resolution is 10-bit or 12-bit.

#### Example:

Interleaved dual mode: a DMA request is generated each time 2 data items are available:

1st DMA request: ADCx\_CDR[31:0] = SLV\_ADC\_DR[15:0] | MST\_ADC\_DR[15:0]

2nd DMA request: ADCx\_CDR[31:0] = SLV\_ADC\_DR[15:0] |  
MST\_ADC\_DR[15:0]

**Figure 132. DMA requests in regular simultaneous mode when MDMA = 10****Figure 133. DMA requests in interleaved mode when MDMA = 10**

**Note:** *When using MDMA mode, the user must take care to configure properly the duration of the master and slave conversions so that a DMA request is generated and served for reading both data (master + slave) before a new conversion is available.*

- **MDMA = 11:** This mode is similar to the MDMA = 10. The only differences are that on each DMA request (two data items are available), two bytes representing two ADC converted data items are transferred as a half-word.

This mode is used in interleaved and regular simultaneous mode when resolution is 6-bit or when resolution is 8-bit and data is not signed (offsets must be disabled for all the involved channels).

**Example:**

Interleaved dual mode: a DMA request is generated each time 2 data items are available:

1st DMA request: `ADCx_CDR[15:0] = SLV_ADC_DR[7:0] | MST_ADC_DR[7:0]`

2nd DMA request: `ADCx_CDR[15:0] = SLV_ADC_DR[7:0] | MST_ADC_DR[7:0]`

### Overrun detection

In dual ADC mode (when `DUAL[4:0]` is not equal to 00000), if an overrun is detected on one of the ADCs, the DMA requests are no longer issued to ensure that all the data transferred to the RAM are valid (this behavior occurs whatever the MDMA configuration). It may happen that the EOC bit corresponding to one ADC remains set because the data register of this ADC contains valid data.

### DMA one shot mode/ DMA circular mode when MDMA mode is selected

When MDMA mode is selected (10 or 11), bit `DMACFG` of the `ADCx_CCR` register must also be configured to select between DMA one shot mode and circular mode, as explained in section [Section : Managing conversions using the DMA](#) (bits `DMACFG` of master and slave `ADC_CFGR` are not relevant).

### Stopping the conversions in dual ADC modes

The user must set the control bits `ADSTP/JADSTP` of the master ADC to stop the conversions of both ADC in dual ADC mode. The other `ADSTP` control bit of the slave ADC has no effect in dual ADC mode.

Once both ADC are effectively stopped, the bits `ADSTART/JADSTART` of the master and slave ADCs are both cleared by hardware.

### DFSDM mode in dual ADC interleaved mode

In dual ADC interleaved modes (`DUAL[4:0] = 00011` or `DUAL[4:0] = 00111`), the ADC conversion results can be transferred directly to the DFSDM.

The DFSDM mode is enabled by setting `DFSDMCFG` bits to 1 in the master ADC `ADC_CFGR` register.

The ADC transfers alternatively the 16 least significant bits of the regular data register from the master and the slave converter to a single channel of the DFSDM. Each transfer resets the EOC flag of each channel once the transfer is complete.

To use this mode, the application software must configure `MDMA[1:0]` bits of `ADCx_CCR` to 01.

The data format must be 16-bit signed:

ADC\_DR[15:12] = sign extended

ADC\_DR[11] = sign

ADC\_DR[10:0] = data

To obtain 16-bit signed format, the software needs to configure OFFSETy[11:0] bits to 0x800 after having set OFFSETy\_EN to 1.

Only right aligned data can be provided to the DFSDM input format. (see [Figure 97: Right alignment \(offset enabled, signed value\)](#))

### DFSDM mode in dual ADC simultaneous mode

The dual mode is not required to use DFSDM in dual ADC simultaneous mode since conversion data is treated by each individual channel. Single mode with same trigger source results in simultaneous conversion with DFSDM interface.

## 18.4.32 Temperature sensor

The temperature sensor can be used to measure the junction temperature ( $T_j$ ) of the device. The temperature sensor is internally connected to the ADC input channels which are used to convert the sensor output voltage to a digital value. When not in use, the sensor can be put in power down mode. It support the temperature range  $-40$  to  $125$  °C.

[Figure 134](#) shows the block diagram of connections between the temperature sensor and the ADC.

The temperature sensor output voltage changes linearly with temperature. The offset of this line varies from chip to chip due to process variation (up to  $45$  °C from one chip to another).

The uncalibrated internal temperature sensor is more suited for applications that detect temperature variations instead of absolute temperatures. To improve the accuracy of the temperature sensor measurement, calibration values are stored in system memory for each device by ST during production.

During the manufacturing process, the calibration data of the temperature sensor and the internal voltage reference are stored in the system memory area. The user application can then read them and use them to improve the accuracy of the temperature sensor or the internal reference (refer to the datasheet for additional information).

The temperature sensor is internally connected to the ADC input channel which is used to convert the sensor's output voltage to a digital value. Refer to the electrical characteristics section of the device datasheet for the sampling time value to be applied when converting the internal temperature sensor.

When not in use, the sensor can be put in power-down mode.

[Figure 134](#) shows the block diagram of the temperature sensor.

Figure 134. Temperature sensor channel block diagram

1. The CH17SEL bit must be set to enable the conversion of the temperature sensor voltage  $V_{TS}$ .

### Reading the temperature

To use the sensor:

1. Select an ADC input channel that is connected to  $V_{TS}$ .
2. Program with the appropriate sampling time (refer to electrical characteristics section of the device datasheet).
3. Set the CH17SEL bit in the ADCx\_CCR register to wake up the temperature sensor from power-down mode.
4. Start the ADC conversion.
5. Read the resulting  $V_{TS}$  data in the ADC data register.
6. Calculate the actual temperature using the following formula:

$$\text{Temperature (in } ^\circ\text{C)} = \frac{\text{TS\_CAL2\_TEMP} - \text{TS\_CAL1\_TEMP}}{\text{TS\_CAL2} - \text{TS\_CAL1}} \times (\text{TS\_DATA} - \text{TS\_CAL1}) + \text{TS\_CAL1\_TEMP}$$

Where:

- TS\_CAL2 is the temperature sensor calibration value acquired at TS\_CAL2\_TEMP.
- TS\_CAL1 is the temperature sensor calibration value acquired at TS\_CAL1\_TEMP.
- TS\_DATA is the actual temperature sensor output value converted by ADC.

Refer to the device datasheet for more information about TS\_CAL1 and TS\_CAL2 calibration points.

**Note:** The sensor has a startup time after waking from power-down mode before it can output  $V_{TS}$  at the correct level. The ADC also has a startup time after power-on, so to minimize the delay, the ADEN and CH17SEL bits should be set at the same time.

The above formula is given for TS\_DATA measurement done with the same  $V_{REF+}$  voltage as TS\_CAL1/TS\_CAL2 values. If  $V_{REF+}$  is different, the formula must be adapted. For example if  $V_{REF+} = 3.3\text{ V}$  and TS\_CAL data are acquired at  $V_{REF+} = 3.0\text{ V}$ , TS\_DATA must be replaced by  $\text{TS\_DATA} \times (3.3/3.0)$ .

### 18.4.33 $V_{BAT}$ supply monitoring

The CH18SEL bit in the ADCx\_CCR register is used to switch to the battery voltage. As the  $V_{BAT}$  voltage could be higher than  $V_{DDA}$ , to ensure the correct operation of the ADC, the  $V_{BAT}$  pin is internally connected to a bridge divider by 3. This bridge is automatically enabled when CH18SEL is set, to connect  $V_{BAT}/3$  to the ADC input channels. As a consequence, the converted digital value is one third of the  $V_{BAT}$  voltage. To prevent any unwanted consumption on the battery, it is recommended to enable the bridge divider only when needed, for ADC conversion.

Refer to the electrical characteristics of the device datasheet for the sampling time value to be applied when converting the  $V_{BAT}/3$  voltage.

The figure below shows the block diagram of the  $V_{BAT}$  sensing feature.

**Figure 135.  $V_{BAT}$  channel block diagram**

1. The CH18SEL bit must be set to enable the conversion of internal channel for  $V_{BAT}/3$ .

### 18.4.34 Monitoring the internal voltage reference

It is possible to monitor the internal voltage reference ( $V_{REFINT}$ ) to have a reference point for evaluating the ADC  $V_{REF+}$  voltage level.

The internal voltage reference is internally connected to the input channel 0 of the ADC1 (ADC1\_INP0).

Refer to the electrical characteristics section of the product datasheet for the sampling time value to be applied when converting the internal voltage reference voltage.

*Figure 136* shows the block diagram of the  $V_{REFINT}$  sensing feature.

Figure 136.  $V_{REFINT}$  channel block diagram

1. The VREFEN bit into ADCx\_CCR register must be set to enable the conversion of internal channels ( $V_{REFINT}$ ).

### Calculating the actual $V_{REF+}$ voltage using the internal reference voltage

The power supply voltage applied to the device may be subject to variations or not precisely known. When  $V_{DDA}$  is connected to  $V_{REF+}$ , it is possible to compute the actual  $V_{DDA}$  voltage using the embedded internal reference voltage ( $V_{REFINT}$ ).  $V_{REFINT}$  and its calibration data, acquired by the ADC during the manufacturing process at  $V_{DDA\_Charac}$ , can be used to evaluate the actual  $V_{DDA}$  voltage level.

The following formula gives the actual  $V_{REF+}$  voltage supplying the device:

$$V_{REF+} = V_{REF+_Charac} \times VREFINT\_CAL / VREFINT\_DATA$$

Where:

- $V_{REF+_Charac}$  is the value of  $V_{REF+}$  voltage characterized at  $V_{REFINT}$  during the manufacturing process. It is specified in the device datasheet.
- $VREFINT\_CAL$  is the  $V_{REFINT}$  calibration value
- $VREFINT\_DATA$  is the actual  $V_{REFINT}$  output value converted by ADC

### Converting a supply-relative ADC measurement to an absolute voltage value

The ADC is designed to deliver a digital value corresponding to the ratio between  $V_{REF+}$  and the voltage applied on the converted channel.

For most applications  $V_{DDA}$  value is unknown and ADC converted values are right-aligned. In this case, it is necessary to convert this ratio into a voltage independent from  $V_{DDA}$ :

$$V_{CHANNELx} = \frac{V_{REF+}}{FULL\_SCALE} \times ADC\_DATA$$

By replacing  $V_{REF+}$  by the formula provided above, the absolute voltage value is given by the following formula

$$V_{CHANNELx} = \frac{V_{REF+\_Charac} \times VREFINT\_CAL \times ADC\_DATA}{VREFINT\_DATA \times FULL\_SCALE}$$

For applications where  $V_{REF+}$  is known and ADC converted values are right-aligned, the absolute voltage value can be obtained by using the following formula:

$$V_{CHANNELx} = \frac{V_{REF+}}{FULL\_SCALE} \times ADC\_DATA$$

Where:

- $V_{REF+\_Charac}$  is the value of  $V_{REF+}$  voltage characterized at  $V_{REFINT}$  during the manufacturing process.
- $VREFINT\_CAL$  is the  $V_{REFINT}$  calibration value
- $ADC\_DATA$  is the value measured by the ADC on channel x (right-aligned)
- $VREFINT\_DATA$  is the actual  $V_{REFINT}$  output value converted by the ADC
- $FULL\_SCALE$  is the maximum digital value of the ADC output. For example with 12-bit resolution, it is  $2^{12} - 1 = 4095$  or with 8-bit resolution,  $2^8 - 1 = 255$ .

**Note:** If ADC measurements are done using an output format other than 16-bit right-aligned, all the parameters must first be converted to a compatible format before the calculation is done.

## 18.5 ADC in low-power mode

**Table 117. Effect of low-power modes on the ADC**

| Mode            | Description                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sleep           | No effect.<br>DMA requests are functional.                                                                                                                                   |
| Low-power run   | No effect.                                                                                                                                                                   |
| Low-power sleep | No effect.<br>DMA requests are functional.                                                                                                                                   |
| Stop 0/Stop 1   | The ADC is not operational. Its state is kept.<br>The ADC consumes the static current recommended to disable the peripheral in advance in order to reduce power consumption. |
| Stop 2          | The ADC is not operational. Its state is kept.<br>The ADC regulator is disabled by hardware.<br>ADC and regulator must be disabled before entering Stop 2 mode.              |
| Standby         | The ADC is powered down and must be reinitialized after exiting Standby or Shutdown mode.                                                                                    |
| Shutdown        |                                                                                                                                                                              |

## 18.6 ADC interrupts

For each ADC, an interrupt can be generated:

- After ADC power-up, when the ADC is ready (flag ADRDY)
- On the end of any conversion for regular groups (flag EOC)
- On the end of a sequence of conversion for regular groups (flag EOS)
- On the end of any conversion for injected groups (flag JEOP)
- On the end of a sequence of conversion for injected groups (flag JEOS)
- When an analog watchdog detection occurs (flag AWD1, AWD2 and AWD3)
- When the end of sampling phase occurs (flag EOSMP)
- When the data overrun occurs (flag OVR)
- When the injected sequence context queue overflows (flag JQOVF)

Separate interrupt enable bits are available for flexibility.

**Table 118. ADC interrupts per each ADC**

| Interrupt event                                     | Event flag | Enable control bit |
|-----------------------------------------------------|------------|--------------------|
| ADC ready                                           | ADRDY      | ADRDYIE            |
| End of conversion of a regular group                | EOC        | EOCIE              |
| End of sequence of conversions of a regular group   | EOS        | EOSIE              |
| End of conversion of a injected group               | JEOP       | JEOPIE             |
| End of sequence of conversions of an injected group | JEOS       | JEOSIE             |
| Analog watchdog 1 status bit is set                 | AWD1       | AWD1IE             |
| Analog watchdog 2 status bit is set                 | AWD2       | AWD2IE             |
| Analog watchdog 3 status bit is set                 | AWD3       | AWD3IE             |
| End of sampling phase                               | EOSMP      | EOSMPIE            |
| Overrun                                             | OVR        | OVRIE              |
| Injected context queue overflows                    | JQOVF      | JQOVFIE            |

## 18.7 ADC registers (for each ADC)

Refer to [Section 1.2 on page 69](#) for a list of abbreviations used in register descriptions.

### 18.7.1 ADC interrupt and status register (ADC\_ISR)

Address offset: 0x00

Reset value: 0x0000 0000

|      |      |      |      |      |       |       |       |       |       |       |       |       |       |       |       |
|------|------|------|------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25    | 24    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16    |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  |
|      |      |      |      |      |       |       |       |       |       |       |       |       |       |       |       |
| 15   | 14   | 13   | 12   | 11   | 10    | 9     | 8     | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| Res. | Res. | Res. | Res. | Res. | JQOVF | AWD3  | AWD2  | AWD1  | JEOS  | JEOS  | OVR   | EOS   | EOC   | EOSMP | ADRDY |
|      |      |      |      |      | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 |

Bits 31:11 Reserved, must be kept at reset value.

**Bit 10 JQOVF:** Injected context queue overflow

This bit is set by hardware when an Overflow of the Injected Queue of Context occurs. It is cleared by software writing 1 to it. Refer to [Section 18.4.21: Queue of context for injected conversions](#) for more information.

0: No injected context queue overflow occurred (or the flag event was already acknowledged and cleared by software)

1: Injected context queue overflow has occurred

**Bit 9 AWD3:** Analog watchdog 3 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LT3[7:0] and HT3[7:0] of ADC\_TR3 register. It is cleared by software writing 1 to it.

0: No analog watchdog 3 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 3 event occurred

**Bit 8 AWD2:** Analog watchdog 2 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LT2[7:0] and HT2[7:0] of ADC\_TR2 register. It is cleared by software writing 1 to it.

0: No analog watchdog 2 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 2 event occurred

**Bit 7 AWD1:** Analog watchdog 1 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LT1[11:0] and HT1[11:0] of ADC\_TR1 register. It is cleared by software writing 1 to it.

0: No analog watchdog 1 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 1 event occurred

**Bit 6 JEOS:** Injected channel end of sequence flag

This bit is set by hardware at the end of the conversions of all injected channels in the group. It is cleared by software writing 1 to it.

0: Injected conversion sequence not complete (or the flag event was already acknowledged and cleared by software)

1: Injected conversions complete

**Bit 5 JEOC:** Injected channel end of conversion flag

This bit is set by hardware at the end of each injected conversion of a channel when a new data is available in the corresponding ADC\_JDRy register. It is cleared by software writing 1 to it or by reading the corresponding ADC\_JDRy register

0: Injected channel conversion not complete (or the flag event was already acknowledged and cleared by software)

1: Injected channel conversion complete

**Bit 4 OVR:** ADC overrun

This bit is set by hardware when an overrun occurs on a regular channel, meaning that a new conversion has completed while the EOC flag was already set. It is cleared by software writing 1 to it.

0: No overrun occurred (or the flag event was already acknowledged and cleared by software)

1: Overrun has occurred

**Bit 3 EOS:** End of regular sequence flag

This bit is set by hardware at the end of the conversions of a regular sequence of channels. It is cleared by software writing 1 to it.

0: Regular Conversions sequence not complete (or the flag event was already acknowledged and cleared by software)

1: Regular Conversions sequence complete

**Bit 2 EOC:** End of conversion flag

This bit is set by hardware at the end of each regular conversion of a channel when a new data is available in the ADC\_DR register. It is cleared by software writing 1 to it or by reading the ADC\_DR register

0: Regular channel conversion not complete (or the flag event was already acknowledged and cleared by software)

1: Regular channel conversion complete

**Bit 1 EOSMP:** End of sampling flag

This bit is set by hardware during the conversion of any channel (only for regular channels), at the end of the sampling phase.

0: not at the end of the sampling phase (or the flag event was already acknowledged and cleared by software)

1: End of sampling phase reached

**Bit 0 ADRDY:** ADC ready

This bit is set by hardware after the ADC has been enabled (bit ADEN = 1) and when the ADC reaches a state where it is ready to accept conversion requests. It is cleared by software writing 1 to it.

0: ADC not yet ready to start conversion (or the flag event was already acknowledged and cleared by software)

1: ADC is ready to start conversion

## 18.7.2 ADC interrupt enable register (ADC\_IER)

Address offset: 0x04

Reset value: 0x0000 0000

|      |      |      |      |      |             |        |        |        |        |        |       |       |       |             |             |

Bits 31:11 Reserved, must be kept at reset value.

**Bit 10 JQOVFIE:** Injected context queue overflow interrupt enable

This bit is set and cleared by software to enable/disable the Injected Context Queue Overflow interrupt.

0: Injected Context Queue Overflow interrupt disabled

1: Injected Context Queue Overflow interrupt enabled. An interrupt is generated when the JQOVF bit is set.

*Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

**Bit 9 AWD3IE:** Analog watchdog 3 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 2 interrupt.

0: Analog watchdog 3 interrupt disabled

1: Analog watchdog 3 interrupt enabled

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

**Bit 8 AWD2IE:** Analog watchdog 2 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 2 interrupt.

0: Analog watchdog 2 interrupt disabled

1: Analog watchdog 2 interrupt enabled

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

**Bit 7 AWD1IE:** Analog watchdog 1 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 1 interrupt.

0: Analog watchdog 1 interrupt disabled

1: Analog watchdog 1 interrupt enabled

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

**Bit 6 JEOSIE:** End of injected sequence of conversions interrupt enable

This bit is set and cleared by software to enable/disable the end of injected sequence of conversions interrupt.

0: JEOS interrupt disabled

1: JEOS interrupt enabled. An interrupt is generated when the JEOS bit is set.

*Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

**Bit 5 JEOCIE:** End of injected conversion interrupt enable

This bit is set and cleared by software to enable/disable the end of an injected conversion interrupt.

0: JEOC interrupt disabled.

1: JEOC interrupt enabled. An interrupt is generated when the JEOC bit is set.

*Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

**Bit 4 OVRIE:** Overrun interrupt enable

This bit is set and cleared by software to enable/disable the Overrun interrupt of a regular conversion.

0: Overrun interrupt disabled

1: Overrun interrupt enabled. An interrupt is generated when the OVR bit is set.

*Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

**Bit 3 EOSIE:** End of regular sequence of conversions interrupt enable

This bit is set and cleared by software to enable/disable the end of regular sequence of conversions interrupt.

0: EOS interrupt disabled

1: EOS interrupt enabled. An interrupt is generated when the EOS bit is set.

*Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

**Bit 2 EOCIE:** End of regular conversion interrupt enable

This bit is set and cleared by software to enable/disable the end of a regular conversion interrupt.

0: EOC interrupt disabled.

1: EOC interrupt enabled. An interrupt is generated when the EOC bit is set.

*Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

**Bit 1 EOSMPIE:** End of sampling flag interrupt enable for regular conversions

This bit is set and cleared by software to enable/disable the end of the sampling phase interrupt for regular conversions.

0: EOSMP interrupt disabled.

1: EOSMP interrupt enabled. An interrupt is generated when the EOSMP bit is set.

*Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

**Bit 0 ADRDYIE:** ADC ready interrupt enable

This bit is set and cleared by software to enable/disable the ADC Ready interrupt.

0: ADRDY interrupt disabled

1: ADRDY interrupt enabled. An interrupt is generated when the ADRDY bit is set.

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

### 18.7.3 ADC control register (ADC\_CR)

Address offset: 0x08

Reset value: 0x2000 0000

**Bit 31 ADCAL:** ADC calibration

This bit is set by software to start the calibration of the ADC. Program first the bit ADCALDIF to determine if this calibration applies for single-ended or differential inputs mode.

It is cleared by hardware after calibration is complete.

0: Calibration complete

1: Write 1 to calibrate the ADC. Read at 1 means that a calibration in progress.

*Note: The software is allowed to launch a calibration by setting ADCAL only when ADEN = 0.*

*The software is allowed to update the calibration factor by writing ADC\_CALFACT only when ADEN = 1 and ADSTART = 0 and JADSTART = 0 (ADC enabled and no conversion is ongoing)*

**Bit 30 ADCALDIF:** Differential mode for calibration

This bit is set and cleared by software to configure the single-ended or differential inputs mode for the calibration.

0: Writing ADCAL launches a calibration in single-ended inputs mode.

1: Writing ADCAL launches a calibration in differential inputs mode.

*Note: The software is allowed to write this bit only when the ADC is disabled and is not calibrating (ADCAL = 0, JADSTART = 0, JADSTP = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).*

**Bit 29 DEEPPWD:** Deep-power-down enable

This bit is set and cleared by software to put the ADC in Deep-power-down mode.

0: ADC not in Deep-power down

1: ADC in Deep-power-down (default reset state)

*Note: The software is allowed to write this bit only when the ADC is disabled (ADCAL = 0, JADSTART = 0, JADSTP = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).*

**Bit 28 ADVREGEN:** ADC voltage regulator enable

This bits is set by software to enable the ADC voltage regulator.

Before performing any operation such as launching a calibration or enabling the ADC, the ADC voltage regulator must first be enabled and the software must wait for the regulator start-up time.

0: ADC Voltage regulator disabled

1: ADC Voltage regulator enabled.

For more details about the ADC voltage regulator enable and disable sequences, refer to [Section 18.4.6: ADC Deep-power-down mode \(DEEPPWD\) and ADC voltage regulator \(ADVREGEN\)](#).

The software can program this bit field only when the ADC is disabled (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).

Bits 27:6 Reserved, must be kept at reset value.

**Bit 5 JADSTP:** ADC stop of injected conversion command

This bit is set by software to stop and discard an ongoing injected conversion (JADSTP Command).

It is cleared by hardware when the conversion is effectively discarded and the ADC injected sequence and triggers can be re-configured. The ADC is then ready to accept a new start of injected conversions (JADSTART command).

0: No ADC stop injected conversion command ongoing

1: Write 1 to stop injected conversions ongoing. Read 1 means that an ADSTP command is in progress.

*Note: The software is allowed to set JADSTP only when JADSTART = 1 and ADDIS = 0 (ADC is enabled and eventually converting an injected conversion and there is no pending request to disable the ADC)*

*In Auto-injection mode (JAUTO = 1), setting ADSTP bit aborts both regular and injected conversions (do not use JADSTP)*

**Bit 4 ADSTP:** ADC stop of regular conversion command

This bit is set by software to stop and discard an ongoing regular conversion (ADSTP Command).

It is cleared by hardware when the conversion is effectively discarded and the ADC regular sequence and triggers can be re-configured. The ADC is then ready to accept a new start of regular conversions (ADSTART command).

0: No ADC stop regular conversion command ongoing

1: Write 1 to stop regular conversions ongoing. Read 1 means that an ADSTP command is in progress.

*Note: The software is allowed to set ADSTP only when ADSTART = 1 and ADDIS = 0 (ADC is enabled and eventually converting a regular conversion and there is no pending request to disable the ADC).*

*In auto-injection mode (JAUTO = 1), setting ADSTP bit aborts both regular and injected conversions (do not use JADSTP).*

*In dual ADC regular simultaneous mode and interleaved mode, the bit ADSTP of the master ADC must be used to stop regular conversions. The other ADSTP bit is inactive.*

**Bit 3 JADSTART:** ADC start of injected conversion

This bit is set by software to start ADC conversion of injected channels. Depending on the configuration bits JEXTEN[1:0], a conversion starts immediately (software trigger configuration) or once an injected hardware trigger event occurs (hardware trigger configuration).

It is cleared by hardware:

- in single conversion mode when software trigger is selected (JEXTSEL = 0x0): at the assertion of the End of Injected Conversion Sequence (JEOS) flag.
- in all cases: after the execution of the JADSTP command, at the same time that JADSTP is cleared by hardware.

0: No ADC injected conversion is ongoing.

1: Write 1 to start injected conversions. Read 1 means that the ADC is operating and eventually converting an injected channel.

*Note: The software is allowed to set JADSTART only when ADEN = 1 and ADDIS = 0 (ADC is enabled and there is no pending request to disable the ADC).*

*In auto-injection mode (JAUTO = 1), regular and auto-injected conversions are started by setting bit ADSTART (JADSTART must be kept cleared)*

**Bit 2 ADSTART:** ADC start of regular conversion

This bit is set by software to start ADC conversion of regular channels. Depending on the configuration bits EXTEN[1:0], a conversion starts immediately (software trigger configuration) or once a regular hardware trigger event occurs (hardware trigger configuration).

It is cleared by hardware:

- in single conversion mode when software trigger is selected (EXTSEL = 0x0): at the assertion of the End of Regular Conversion Sequence (EOS) flag.
- in all cases: after the execution of the ADSTP command, at the same time that ADSTP is cleared by hardware.

0: No ADC regular conversion is ongoing.

1: Write 1 to start regular conversions. Read 1 means that the ADC is operating and eventually converting a regular channel.

*Note: The software is allowed to set ADSTART only when ADEN = 1 and ADDIS = 0 (ADC is enabled and there is no pending request to disable the ADC)*

*In auto-injection mode (JAUTO = 1), regular and auto-injected conversions are started by setting bit ADSTART (JADSTART must be kept cleared)*

**Bit 1 ADDIS:** ADC disable command

This bit is set by software to disable the ADC (ADDIS command) and put it into power-down state (OFF state).

It is cleared by hardware once the ADC is effectively disabled (ADEN is also cleared by hardware at this time).

0: no ADDIS command ongoing

1: Write 1 to disable the ADC. Read 1 means that an ADDIS command is in progress.

*Note: The software is allowed to set ADDIS only when ADEN = 1 and both ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing)*

**Bit 0 ADEN:** ADC enable control

This bit is set by software to enable the ADC. The ADC is effectively ready to operate once the flag ADRDY has been set.

It is cleared by hardware when the ADC is disabled, after the execution of the ADDIS command.

0: ADC is disabled (OFF state)

1: Write 1 to enable the ADC.

*Note: The software is allowed to set ADEN only when all bits of ADC\_CR registers are 0 (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0) except for bit ADVREGEN which must be 1 (and the software must have wait for the startup time of the voltage regulator)*

## 18.7.4 ADC configuration register (ADC\_CFGR)

Address offset: 0x0C

Reset value: 0x8000 0000

|       |             |      |         |            |    |          |          |          |          |       |          |              |           |         |         |

Bit 31 **JQDIS**: Injected Queue disable

These bits are set and cleared by software to disable the Injected Queue mechanism :

0: Injected Queue enabled

1: Injected Queue disabled

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no regular nor injected conversion is ongoing).*

*A set or reset of JQDIS bit causes the injected queue to be flushed and the JSQR register is cleared.*

Bits 30:26 **AWD1CH[4:0]**: Analog watchdog 1 channel selection

These bits are set and cleared by software. They select the input channel to be guarded by the analog watchdog.

00000: ADC analog input channel 0 monitored by AWD1 (available on ADC1 only)

00001: ADC analog input channel 1 monitored by AWD1

.....

10010: ADC analog input channel 18 monitored by AWD1

others: reserved, must not be used

*Note: Some channels are not connected physically. Keep the corresponding AWD1CH[4:0] setting to the reset value.*

*The channel selected by AWD1CH must be also selected into the SQRi or JSQRi registers.*

*The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

Bit 25 **JAUTO**: Automatic injected group conversion

This bit is set and cleared by software to enable/disable automatic injected group conversion after regular group conversion.

0: Automatic injected group conversion disabled

1: Automatic injected group conversion enabled

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no regular nor injected conversion is ongoing).*

*When dual mode is enabled (DUAL bits in ADCx\_CCR register are not equal to zero), the bit JAUTO of the slave ADC is no more writable and its content is equal to the bit JAUTO of the master ADC.*

Bit 24 **JAWD1EN**: Analog watchdog 1 enable on injected channels

This bit is set and cleared by software

0: Analog watchdog 1 disabled on injected channels

1: Analog watchdog 1 enabled on injected channels

*Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

Bit 23 **AWD1EN**: Analog watchdog 1 enable on regular channels

This bit is set and cleared by software

0: Analog watchdog 1 disabled on regular channels

1: Analog watchdog 1 enabled on regular channels

*Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 22 **AWD1SGL**: Enable the watchdog 1 on a single channel or on all channels

This bit is set and cleared by software to enable the analog watchdog on the channel identified by the AWD1CH[4:0] bits or on all the channels

0: Analog watchdog 1 enabled on all channels

1: Analog watchdog 1 enabled on a single channel

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

Bit 21 **JQM**: JSQR queue mode

This bit is set and cleared by software.

It defines how an empty Queue is managed.

0: JSQR mode 0: The Queue is never empty and maintains the last written configuration into JSQR.

1: JSQR mode 1: The Queue can be empty and when this occurs, the software and hardware triggers of the injected sequence are both internally disabled just after the completion of the last valid injected sequence.

Refer to [Section 18.4.21: Queue of context for injected conversions](#) for more information.

*Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

*When dual mode is enabled (DUAL bits in ADCx\_CCR register are not equal to zero), the bit JQM of the slave ADC is no more writable and its content is equal to the bit JQM of the master ADC.*

Bit 20 **JDISCEN**: Discontinuous mode on injected channels

This bit is set and cleared by software to enable/disable discontinuous mode on the injected channels of a group.

0: Discontinuous mode on injected channels disabled

1: Discontinuous mode on injected channels enabled

*Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

*It is not possible to use both auto-injected mode and discontinuous mode simultaneously: the bits DISCEN and JDISCEN must be kept cleared by software when JAUTO is set.*

*When dual mode is enabled (bits DUAL of ADCx\_CCR register are not equal to zero), the bit JDISCEN of the slave ADC is no more writable and its content is equal to the bit JDISCEN of the master ADC.*

Bits 19:17 **DISCNUM[2:0]**: Discontinuous mode channel count

These bits are written by software to define the number of regular channels to be converted in discontinuous mode, after receiving an external trigger.

000: 1 channel

001: 2 channels

...

111: 8 channels

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

*When dual mode is enabled (DUAL bits in ADCx\_CCR register are not equal to zero), the bits DISCNUM[2:0] of the slave ADC are no more writable and their content is equal to the bits DISCNUM[2:0] of the master ADC.*

Bit 16 **DISCEN**: Discontinuous mode for regular channels

This bit is set and cleared by software to enable/disable Discontinuous mode for regular channels.

0: Discontinuous mode for regular channels disabled

1: Discontinuous mode for regular channels enabled

*Note: It is not possible to have both discontinuous mode and continuous mode enabled: it is forbidden to set both DISCEN = 1 and CONT = 1.*

*It is not possible to use both auto-injected mode and discontinuous mode simultaneously: the bits DISCEN and JDISCEN must be kept cleared by software when JAUTO is set.*

*The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

*When dual mode is enabled (DUAL bits in ADCx\_CCR register are not equal to zero), the bit DISCEN of the slave ADC is no more writable and its content is equal to the bit DISCEN of the master ADC.*

Bit 15 Reserved, must be kept at reset value.

Bit 14 **AUTDLY**: Delayed conversion mode

This bit is set and cleared by software to enable/disable the Auto Delayed Conversion mode.

0: Auto-delayed conversion mode off

1: Auto-delayed conversion mode on

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

*When dual mode is enabled (DUAL bits in ADCx\_CCR register are not equal to zero), the bit AUTDLY of the slave ADC is no more writable and its content is equal to the bit AUTDLY of the master ADC.*

Bit 13 **CONT**: Single / continuous conversion mode for regular conversions

This bit is set and cleared by software. If it is set, regular conversion takes place continuously until it is cleared.

0: Single conversion mode

1: Continuous conversion mode

*Note: It is not possible to have both discontinuous mode and continuous mode enabled: it is forbidden to set both DISCEN = 1 and CONT = 1.*

*The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

*When dual mode is enabled (DUAL bits in ADCx\_CCR register are not equal to zero), the bit CONT of the slave ADC is no more writable and its content is equal to the bit CONT of the master ADC.*

Bit 12 **OVRMOD**: Overrun mode

This bit is set and cleared by software and configure the way data overrun is managed.

0: ADC\_DR register is preserved with the old data when an overrun is detected.

1: ADC\_DR register is overwritten with the last conversion result when an overrun is detected.

*Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bits 11:10 **EXTEN[1:0]**: External trigger enable and polarity selection for regular channels

These bits are set and cleared by software to select the external trigger polarity and enable the trigger of a regular group.

00: Hardware trigger detection disabled (conversions can be launched by software)

01: Hardware trigger detection on the rising edge

10: Hardware trigger detection on the falling edge

11: Hardware trigger detection on both the rising and falling edges

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bits 9:6 **EXTSEL[3:0]**: External trigger selection for regular group

These bits select the external event used to trigger the start of conversion of a regular group:

0000: Event 0

0001: Event 1

0010: Event 2

0011: Event 3

0100: Event 4

0101: Event 5

0110: Event 6

0111: Event 7

...

1111: Event 15

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 5 **ALIGN**: Data alignment

This bit is set and cleared by software to select right or left alignment. Refer to [Section : Data register, data alignment and offset \(ADC\\_DR, OFFSETy, OFFSETy\\_CH, ALIGN\)](#)

0: Right alignment

1: Left alignment

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

Bits 4:3 **RES[1:0]**: Data resolution

These bits are written by software to select the resolution of the conversion.

00: 12-bit

01: 10-bit

10: 8-bit

11: 6-bit

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

**Bit 2 DFSDMCFG:** DFSDM mode configuration

This bit is set and cleared by software to enable the DFSDM mode. It is effective only when DMAEN = 0.

0: DFSDM mode disabled

1: DFSDM mode enabled

*Note:* To make sure no conversion is ongoing, the software is allowed to write this bit only when ADSTART= 0 and JADSTART= 0.

**Bit 1 DMACFG:** Direct memory access configuration

This bit is set and cleared by software to select between two DMA modes of operation and is effective only when DMAEN = 1.

0: DMA One Shot mode selected

1: DMA Circular mode selected

For more details, refer to [Section : Managing conversions using the DMA](#)

*Note:* The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

*In dual-ADC modes, this bit is not relevant and replaced by control bit DMACFG of the ADCx\_CCR register.*

**Bit 0 DMAEN:** Direct memory access enable

This bit is set and cleared by software to enable the generation of DMA requests. This allows to use the DMA to manage automatically the converted data. For more details, refer to [Section : Managing conversions using the DMA](#).

0: DMA disabled

1: DMA enabled

*Note:* The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

*In dual-ADC modes, this bit is not relevant and replaced by control bits MDMA[1:0] of the ADCx\_CCR register.*

**18.7.5 ADC configuration register 2 (ADC\_CFGR2)**

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:17 Reserved, must be kept at reset value.

Bits 16:11 Reserved, must be kept at reset value.

Bit 10 **ROVSM**: Regular Oversampling mode

This bit is set and cleared by software to select the regular oversampling mode.

0: Continued mode: When injected conversions are triggered, the oversampling is temporary stopped and continued after the injection sequence (oversampling buffer is maintained during injected sequence)

1: Resumed mode: When injected conversions are triggered, the current oversampling is aborted and resumed from start after the injection sequence (oversampling buffer is zeroed by injected sequence start)

*Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing).*

Bit 9 **TROVS**: Triggered Regular Oversampling

This bit is set and cleared by software to enable triggered oversampling

0: All oversampled conversions for a channel are done consecutively following a trigger

1: Each oversampled conversion for a channel needs a new trigger

*Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing).*

Bits 8:5 **OVSS[3:0]**: Oversampling shift

This bitfield is set and cleared by software to define the right shifting applied to the raw oversampling result.

0000: No shift

0001: Shift 1-bit

0010: Shift 2-bits

0011: Shift 3-bits

0100: Shift 4-bits

0101: Shift 5-bits

0110: Shift 6-bits

0111: Shift 7-bits

1000: Shift 8-bits

Other codes reserved

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no conversion is ongoing).*

Bits 4:2 **OVSR[2:0]**: Oversampling ratio

This bitfield is set and cleared by software to define the oversampling ratio.

000: 2x  
 001: 4x  
 010: 8x  
 011: 16x  
 100: 32x  
 101: 64x  
 110: 128x  
 111: 256x

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no conversion is ongoing).*

Bit 1 **JOVSE**: Injected Oversampling Enable

This bit is set and cleared by software to enable injected oversampling.

0: Injected Oversampling disabled  
 1: Injected Oversampling enabled

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing)*

Bit 0 **ROVSE**: Regular Oversampling Enable

This bit is set and cleared by software to enable regular oversampling.

0: Regular Oversampling disabled  
 1: Regular Oversampling enabled

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing)*

### 18.7.6 ADC sample time register 1 (ADC\_SMPR1)

Address offset: 0x14

Reset value: 0x0000 0000

|             |           |           |    |           |           |    |           |           |    |           |           |    |           |           |    |

Bit 31 **SMPPLUS**: Addition of one clock cycle to the sampling time.

1: 2.5 ADC clock cycle sampling time becomes 3.5 ADC clock cycles for the ADC\_SMPR1 and ADC\_SMPR2 registers.

0: The sampling time remains set to 2.5 ADC clock cycles remains

*To make sure no conversion is ongoing, the software is allowed to write this bit only when ADSTART= 0 and JADSTART= 0.*

Bit 30 Reserved, must be kept at reset value.

Bits 29:0 **SMPx[2:0]**: Channel x sampling time selection (x = 9 to 0)

These bits are written by software to select the sampling time individually for each channel. During sample cycles, the channel selection bits must remain unchanged.

000: 2.5 ADC clock cycles

001: 6.5 ADC clock cycles

010: 12.5 ADC clock cycles

011: 24.5 ADC clock cycles

100: 47.5 ADC clock cycles

101: 92.5 ADC clock cycles

110: 247.5 ADC clock cycles

111: 640.5 ADC clock cycles

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

*Some channels are not connected physically. Keep the corresponding SMPx[2:0] setting to the reset value.*

### 18.7.7 ADC sample time register 2 (ADC\_SMPR2)

Address offset: 0x18

Reset value: 0x0000 0000

|          |     |            |     |            |            |    |            |            |    |            |            |    |            |            |    |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **HT1[11:0]**: Analog watchdog 1 higher threshold

These bits are written by software to define the higher threshold for the analog watchdog 1.

Refer to [Section 18.4.29: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTx, AWD\\_LTx, AWDx\)](#)

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **LT1[11:0]**: Analog watchdog 1 lower threshold

These bits are written by software to define the lower threshold for the analog watchdog 1.

Refer to [Section 18.4.29: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTx, AWD\\_LTx, AWDx\)](#)

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

### 18.7.9 ADC watchdog threshold register 2 (ADC\_TR2)

Address offset: 0x24

Reset value: 0x00FF 0000

|      |      |      |      |      |      |      |      |          |     |     |     |     |     |     |     |
|------|------|------|------|------|------|------|------|----------|-----|-----|-----|-----|-----|-----|-----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23       | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HT2[7:0] |     |     |     |     |     |     |     |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **HT2[7:0]**: Analog watchdog 2 higher threshold

These bits are written by software to define the higher threshold for the analog watchdog 2.

Refer to [Section 18.4.29: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTx, AWD\\_LTx, AWDx\)](#)

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **LT2[7:0]**: Analog watchdog 2 lower threshold

These bits are written by software to define the lower threshold for the analog watchdog 2.

Refer to [Section 18.4.29: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTx, AWD\\_LTx, AWDx\)](#)

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

### 18.7.10 ADC watchdog threshold register 3 (ADC\_TR3)

Address offset: 0x28

Reset value: 0x00FF 0000

|      |      |      |      |      |      |      |      |          |     |     |     |     |     |     |     |
|------|------|------|------|------|------|------|------|----------|-----|-----|-----|-----|-----|-----|-----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23       | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HT3[7:0] |     |     |     |     |     |     |     |
|      |      |      |      |      |      |      |      | r/w      | r/w | r/w | r/w | r/w | r/w | r/w | r/w |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7        | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LT3[7:0] |     |     |     |     |     |     |     |
|      |      |      |      |      |      |      |      | r/w      | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **HT3[7:0]**: Analog watchdog 3 higher threshold

These bits are written by software to define the higher threshold for the analog watchdog 3.

Refer to [Section 18.4.29: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTx, AWD\\_LTx, AWDx\)](#)

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **LT3[7:0]**: Analog watchdog 3 lower threshold

These bits are written by software to define the lower threshold for the analog watchdog 3.

This watchdog compares the 8-bit of LT3 with the 8 MSB of the converted data.

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

## 18.7.11 ADC regular sequence register 1 (ADC\_SQR1)

Address offset: 0x30

Reset value: 0x0000 0000

|          |      |      |          |          |    |    |    |      |          |      |        |    |    |      |        |

| Res.     | Res. | Res. | SQ4[4:0] |          |    |    |    | Res. | SQ3[4:0] |      |        |    |    | Res. | SQ2[4] |
|          |      |      | rw       | rw       | rw | rw | rw |      | rw       | rw   | rw     | rw | rw |      | rw     |
| 15       | 14   | 13   | 12       | 11       | 10 | 9  | 8  | 7    | 6        | 5    | 4      | 3  | 2  | 1    | 0      |
| SQ2[3:0] |      |      | Res.     | SQ1[4:0] |    |    |    |      | Res.     | Res. | L[3:0] |    |    |      |        |
| rw       | rw   | rw   | rw       |          | rw | rw | rw | rw   | rw       |      |        | rw | rw | rw   | rw     |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ4[4:0]**: 4th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 4th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ3[4:0]**: 3rd conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 3rd in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ2[4:0]**: 2nd conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 2nd in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ1[4:0]**: 1st conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 1st in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **L[3:0]**: Regular channel sequence length

These bits are written by software to define the total number of conversions in the regular channel conversion sequence.

0000: 1 conversion

0001: 2 conversions

...

1111: 16 conversions

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

*Note: Some channels are not connected physically and must not be selected for conversion.*

### 18.7.12 ADC regular sequence register 2 (ADC\_SQR2)

Address offset: 0x34

Reset value: 0x0000 0000

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ9[4:0]**: 9th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 9th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ8[4:0]**: 8th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 8th in the regular conversion sequence

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ7[4:0]**: 7th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 7th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ6[4:0]**: 6th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 6th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ5[4:0]**: 5th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 5th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

*Note: Some channels are not connected physically and must not be selected for conversion.*

### 18.7.13 ADC regular sequence register 3 (ADC\_SQR3)

Address offset: 0x38

Reset value: 0x0000 0000

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ14[4:0]**: 14th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 14th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ13[4:0]**: 13th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 13th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ12[4:0]**: 12th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 12th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ11[4:0]**: 11th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 11th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ10[4:0]**: 10th conversion in regular sequence

These bits are written by software with the channel number (0 to 18) assigned as the 10th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

*Note: Some channels are not connected physically and must not be selected for conversion.*

### 18.7.14 ADC regular sequence register 4 (ADC\_SQR4)

Address offset: 0x3C

Reset value: 0x0000 0000

| JSQ2[1:0] |           | Res. | JSQ1[4:0] |     |     |      | JEXTEN[1:0] |     | JEXTSEL[3:0] |     |     |      | JL[1:0]   |     |     |
| r/w       | r/w       |      | r/w       | r/w | r/w | r/w  | r/w         | r/w | r/w          | r/w | r/w | r/w  | r/w       | r/w |     |

Bit 31 Reserved, must be kept at reset value.

Bits 30:26 **JSQ4[4:0]**: 4th conversion in the injected sequence

These bits are written by software with the channel number (0 to 18) assigned as the 4th in the injected conversion sequence.

*Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

Bit 25 Reserved, must be kept at reset value.

Bits 24:20 **JSQ3[4:0]**: 3rd conversion in the injected sequence

These bits are written by software with the channel number (0 to 18) assigned as the 3rd in the injected conversion sequence.

*Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

Bit 19 Reserved, must be kept at reset value.

Bits 18:14 **JSQ2[4:0]**: 2nd conversion in the injected sequence

These bits are written by software with the channel number (0 to 18) assigned as the 2nd in the injected conversion sequence.

*Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

Bit 13 Reserved, must be kept at reset value.

Bits 12:8 **JSQ1[4:0]**: 1st conversion in the injected sequence

These bits are written by software with the channel number (0 to 18) assigned as the 1st in the injected conversion sequence.

*Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

Bits 7:6 **JEXTEN[1:0]**: External Trigger Enable and Polarity Selection for injected channels

These bits are set and cleared by software to select the external trigger polarity and enable the trigger of an injected group.

00: If JQDIS = 0 (queue enabled), Hardware and software trigger detection disabled

00: If JQDIS = 1 (queue disabled), Hardware trigger detection disabled (conversions can be launched by software)

01: Hardware trigger detection on the rising edge

10: Hardware trigger detection on the falling edge

11: Hardware trigger detection on both the rising and falling edges

*Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

*If JQM = 1 and if the Queue of Context becomes empty, the software and hardware triggers of the injected sequence are both internally disabled (refer to [Section 18.4.21: Queue of context for injected conversions](#))*

Bits 5:2 **JEXTSEL[3:0]**: External Trigger Selection for injected group

These bits select the external event used to trigger the start of conversion of an injected group:

0000: Event 0

0001: Event 1

0010: Event 2

0011: Event 3

0100: Event 4

0101: Event 5

0110: Event 6

0111: Event 7

...

1111: Event 15

*Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

Bits 1:0 **JL[1:0]**: Injected channel sequence length

These bits are written by software to define the total number of conversions in the injected channel conversion sequence.

00: 1 conversion

01: 2 conversions

10: 3 conversions

11: 4 conversions

*Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).*

*Note: Some channels are not connected physically and must not be selected for conversion.*

**18.7.17 ADC offset y register (ADC\_OFRy)**Address offset:  $0x60 + 0x04 * (y - 1)$ , ( $y = 1$  to  $4$ )

Reset value: 0x0000 0000

|           |                |      |      |              |    |      |      |      |      |      |      |      |      |      |      |

| Res.      | Res.           | Res. | Res. | OFFSET[11:0] |    |      |      |      |      |      |      |      |      |      |      |
|           |                |      |      | rW           | rW | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   |

**Bit 31 OFFSET\_EN:** Offset y enable

This bit is written by software to enable or disable the offset programmed into bits OFFSETy[11:0].

*Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

**Bits 30:26 OFFSET\_CH[4:0]:** Channel selection for the data offset y

These bits are written by software to define the channel to which the offset programmed into bits OFFSETy[11:0] applies.

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

*Some channels are not connected physically and must not be selected for the data offset y.*

**Bits 25:12** Reserved, must be kept at reset value.**Bits 11:0 OFFSET[11:0]:** Data offset y for the channel programmed into bits OFFSETy\_CH[4:0]

These bits are written by software to define the offset y to be subtracted from the raw converted data when converting a channel (can be regular or injected). The channel to which applies the data offset y must be programmed in the bits OFFSETy\_CH[4:0]. The conversion result can be read from in the ADC\_DR (regular conversion) or from in the ADC\_JDRy registers (injected conversion).

*Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

*If several offset (OFFSETy) point to the same channel, only the offset with the lowest x value is considered for the subtraction.*

*Ex: if OFFSET1\_CH[4:0]=4 and OFFSET2\_CH[4:0]=4, this is OFFSET1[11:0] which is subtracted when converting channel 4.*

**18.7.18 ADC injected channel y data register (ADC\_JDRy)**Address offset:  $0x80 + 0x04 * (y - 1)$ , ( $y = 1$  to  $4$ )

|              |      |      |      |      |      |      |      |      |      |      |      |      | rw            | rw | rw |
| 15           | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2             | 1  | 0  |
| AWD2CH[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |               |    |    |
| rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw            | rw | rw |

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:0 **AWD2CH[18:0]**: Analog watchdog 2 channel selection

These bits are set and cleared by software. They enable and select the input channels to be guarded by the analog watchdog 2.

AWD2CH[i] = 0: ADC analog input channel i is not monitored by AWD2

AWD2CH[i] = 1: ADC analog input channel i is monitored by AWD2

When AWD2CH[18:0] = 000..0, the analog watchdog 2 is disabled

*Note:* The channels selected by AWD2CH must be also selected into the SQRi or JSQRi registers.

The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Some channels are not connected physically and must not be selected for the analog watchdog.

### 18.7.20 ADC analog watchdog 3 configuration register (ADC\_AWD3CR)

Address offset: 0xA4

Reset value: 0x0000 0000

|              |      |      |      |      |      |      |      |      |      |      |      |      |               |     |     |
|--------------|------|------|------|------|------|------|------|------|------|------|------|------|---------------|-----|-----|
| 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18            | 17  | 16  |

| AWD3CH[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |               |     |     |
| r/w          | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w           | r/w | r/w |

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:0 **AWD3CH[18:0]**: Analog watchdog 3 channel selection

These bits are set and cleared by software. They enable and select the input channels to be guarded by the analog watchdog 3.

AWD3CH[i] = 0: ADC analog input channel i is not monitored by AWD3

AWD3CH[i] = 1: ADC analog input channel i is monitored by AWD3

When AWD3CH[18:0] = 000..0, the analog watchdog 3 is disabled

*Note: The channels selected by AWD3CH must be also selected into the SQRi or JSQRi registers.*

*The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).*

*Some channels are not connected physically and must not be selected for the analog watchdog.*

### 18.7.21 ADC differential mode selection register (ADC\_DIFSEL)

Address offset: 0xB0

Reset value: 0x0000 0000

|              |      |      |      |      |      |      |      |      |      |      |      |      |               |     |     |
|--------------|------|------|------|------|------|------|------|------|------|------|------|------|---------------|-----|-----|
| 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18            | 17  | 16  |
| Res.         | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DIFSEL[18:16] |     |     |
|              |      |      |      |      |      |      |      |      |      |      |      |      | r/w           | r/w | r/w |
| 15           | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2             | 1   | 0   |
| DIFSEL[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |               |     |     |
| r/w          | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w           | r/w | r   |

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:0 **DIFSEL[18:0]**: Differential mode for channels 18 to 0.

These bits are set and cleared by software. They allow to select if a channel is configured as single-ended or differential mode.

DIFSEL[i] = 0: ADC analog input channel is configured in single ended mode

DIFSEL[i] = 1: ADC analog input channel i is configured in differential mode

*Note: The DIFSEL bits corresponding to channels that are either connected to a single-ended I/O port or to an internal channel must be kept their reset value (single-ended input mode).*

*The software is allowed to write these bits only when the ADC is disabled (ADCAL = 0, JADSTART = 0, JADSTP = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).*

### 18.7.22 ADC calibration factors (ADC\_CALFACT)

Address offset: 0xB4

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |                |    |    |    |    |    |    |
|------|------|------|------|------|------|------|------|------|----------------|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22             | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CALFACT_D[6:0] |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      |      | rw             | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6              | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CALFACT_S[6:0] |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      |      | rw             | rw | rw | rw | rw | rw | rw |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **CALFACT\_D[6:0]**: Calibration Factors in differential mode

These bits are written by hardware or by software.

Once a differential inputs calibration is complete, they are updated by hardware with the calibration factors.

Software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored into the analog ADC, it is then applied once a new differential calibration is launched.

*Note: The software is allowed to write these bits only when ADEN = 1, ADSTART = 0 and JADSTART = 0 (ADC is enabled and no calibration is ongoing and no conversion is ongoing).*

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **CALFACT\_S[6:0]**: Calibration Factors In single-ended mode

These bits are written by hardware or by software.

Once a single-ended inputs calibration is complete, they are updated by hardware with the calibration factors.

Software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored into the analog ADC, it is then applied once a new single-ended calibration is launched.

*Note: The software is allowed to write these bits only when ADEN = 1, ADSTART = 0 and JADSTART = 0 (ADC is enabled and no calibration is ongoing and no conversion is ongoing).*

## 18.8 ADC common registers

These registers define the control and status registers common to master and slave ADCs:

### 18.8.1 ADC common status register (ADC\_CSR)

Address offset: 0x300

Reset value: 0x0000 0000

This register provides an image of the status bits of the different ADCs. Nevertheless it is read-only and does not allow to clear the different status bits. Instead each status bit must be cleared by writing 0 to it in the corresponding ADC\_ISR register.

|      |      |      |      |      |           |          |          |          |          |          |         |         |         |           |           |
|------|------|------|------|------|-----------|----------|----------|----------|----------|----------|---------|---------|---------|-----------|-----------|
| 31   | 30   | 29   | 28   | 27   | 26        | 25       | 24       | 23       | 22       | 21       | 20      | 19      | 18      | 17        | 16        |

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **JQOVF\_SLV**: Injected Context Queue Overflow flag of the slave ADC

This bit is a copy of the JQOVF bit in the corresponding ADC\_ISR register.

Bit 25 **AWD3\_SLV**: Analog watchdog 3 flag of the slave ADC

This bit is a copy of the AWD3 bit in the corresponding ADC\_ISR register.

Bit 24 **AWD2\_SLV**: Analog watchdog 2 flag of the slave ADC

This bit is a copy of the AWD2 bit in the corresponding ADC\_ISR register.

Bit 23 **AWD1\_SLV**: Analog watchdog 1 flag of the slave ADC

This bit is a copy of the AWD1 bit in the corresponding ADC\_ISR register.

Bit 22 **JEOS\_SLV**: End of injected sequence flag of the slave ADC

This bit is a copy of the JEOS bit in the corresponding ADC\_ISR register.

Bit 21 **JEOC\_SLV**: End of injected conversion flag of the slave ADC

This bit is a copy of the JEOC bit in the corresponding ADC\_ISR register.

Bit 20 **OVR\_SLV**: Overrun flag of the slave ADC

This bit is a copy of the OVR bit in the corresponding ADC\_ISR register.

Bit 19 **EOS\_SLV**: End of regular sequence flag of the slave ADC. This bit is a copy of the EOS bit in the corresponding ADC\_ISR register.

Bit 18 **EOC\_SLV**: End of regular conversion of the slave ADC

This bit is a copy of the EOC bit in the corresponding ADC\_ISR register.

Bit 17 **EOSMP\_SLV**: End of Sampling phase flag of the slave ADC

This bit is a copy of the EOSMP2 bit in the corresponding ADC\_ISR register.

Bit 16 **ADRDY\_SLV**: Slave ADC ready

This bit is a copy of the ADRDY bit in the corresponding ADC\_ISR register.

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **JQOVF\_MST**: Injected Context Queue Overflow flag of the master ADC

This bit is a copy of the JQOVF bit in the corresponding ADC\_ISR register.

Bit 9 **AWD3\_MST**: Analog watchdog 3 flag of the master ADC

This bit is a copy of the AWD3 bit in the corresponding ADC\_ISR register.

Bit 8 **AWD2\_MST**: Analog watchdog 2 flag of the master ADC

This bit is a copy of the AWD2 bit in the corresponding ADC\_ISR register.

Bit 7 **AWD1\_MST**: Analog watchdog 1 flag of the master ADC

This bit is a copy of the AWD1 bit in the corresponding ADC\_ISR register.

Bit 6 **JEOS\_MST**: End of injected sequence flag of the master ADC

This bit is a copy of the JEOS bit in the corresponding ADC\_ISR register.

- Bit 5 **JEOC\_MST**: End of injected conversion flag of the master ADC  
This bit is a copy of the JEOC bit in the corresponding ADC\_ISR register.
- Bit 4 **OVR\_MST**: Overrun flag of the master ADC  
This bit is a copy of the OVR bit in the corresponding ADC\_ISR register.
- Bit 3 **EOS\_MST**: End of regular sequence flag of the master ADC  
This bit is a copy of the EOS bit in the corresponding ADC\_ISR register.
- Bit 2 **EOC\_MST**: End of regular conversion of the master ADC  
This bit is a copy of the EOC bit in the corresponding ADC\_ISR register.
- Bit 1 **EOSMP\_MST**: End of Sampling phase flag of the master ADC  
This bit is a copy of the EOSMP bit in the corresponding ADC\_ISR register.
- Bit 0 **ADRDY\_MST**: Master ADC ready  
This bit is a copy of the ADRDY bit in the corresponding ADC\_ISR register.

### 18.8.2 ADC common control register (ADC\_CCR)

Address offset: 0x308

Reset value: 0x0000 0000

|           |      |         |      |            |      |      |         |         |        |            |           |    |    |             |    |

Bits 31:25 Reserved, must be kept at reset value.

- Bit 24 **CH18SEL**: CH18 selection  
This bit is set and cleared by software to control channel 18.  
0: V<sub>BAT</sub> channel disabled.  
1: V<sub>BAT</sub> channel enabled
- Bit 23 **CH17SEL**: CH17 selection  
This bit is set and cleared by software to control channel 17.  
0: Temperature sensor channel disabled  
1: Temperature sensor channel enabled
- Bit 22 **VREFEN**: V<sub>REFINT</sub> enable  
This bit is set and cleared by software to enable/disable the V<sub>REFINT</sub> channel.  
0: V<sub>REFINT</sub> channel disabled  
1: V<sub>REFINT</sub> channel enabled

Bits 21:18 **PRESC[3:0]**: ADC prescaler

These bits are set and cleared by software to select the frequency of the clock to the ADC.  
The clock is common for all the ADCs.

0000: input ADC clock not divided  
0001: input ADC clock divided by 2  
0010: input ADC clock divided by 4  
0011: input ADC clock divided by 6  
0100: input ADC clock divided by 8  
0101: input ADC clock divided by 10  
0110: input ADC clock divided by 12  
0111: input ADC clock divided by 16  
1000: input ADC clock divided by 32  
1001: input ADC clock divided by 64  
1010: input ADC clock divided by 128  
1011: input ADC clock divided by 256  
other: reserved

*Note: The software is allowed to write these bits only when the ADC is disabled (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0). The ADC prescaler value is applied only when CKMODE[1:0] = 00.*

Bits 17:16 **CKMODE[1:0]**: ADC clock mode

These bits are set and cleared by software to define the ADC clock scheme (which is common to both master and slave ADCs):

00: CK\_ADCx (x = 123) (Asynchronous clock mode), generated at product level (refer to *Section 6: Reset and clock control (RCC)*)  
01: HCLK/1 (Synchronous clock mode). This configuration must be enabled only if the AHB clock prescaler is set (HPRE[3:0] = 0xxx in RCC\_CFGR register) and if the system clock has a 50% duty cycle.  
10: HCLK/2 (Synchronous clock mode)  
11: HCLK/4 (Synchronous clock mode)

In all synchronous clock modes, there is no jitter in the delay from a timer trigger to the start of a conversion.

*Note: The software is allowed to write these bits only when the ADCs are disabled (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).*

Bits 15:14 **MDMA[1:0]**: Direct memory access mode for dual ADC mode

This bitfield is set and cleared by software. Refer to the DMA controller section for more details.

00: MDMA mode disabled  
01: Enable dual interleaved mode to output to the master channel of DFSDM interface both Master and the Slave result (16-bit data width)  
10: MDMA mode enabled for 12 and 10-bit resolution  
11: MDMA mode enabled for 8 and 6-bit resolution

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 13 **DMACFG**: DMA configuration (for dual ADC mode)

This bit is set and cleared by software to select between two DMA modes of operation and is effective only when DMAEN = 1.

0: DMA One Shot mode selected  
1: DMA Circular mode selected

For more details, refer to [Section : Managing conversions using the DMA](#)

*Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).*

Bit 12 Reserved, must be kept at reset value.

Bits 11:8 **DELAY**: Delay between 2 sampling phases

These bits are set and cleared by software. These bits are used in dual interleaved modes. Refer to [Table 119](#) for the value of ADC resolution versus DELAY bits values.

*Note: The software is allowed to write these bits only when the ADCs are disabled (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).*

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DUAL[4:0]**: Dual ADC mode selection

These bits are written by software to select the operating mode.

All the ADCs independent:

00000: Independent mode

00001 to 01001: Dual mode, master and slave ADCs working together

00001: Combined regular simultaneous + injected simultaneous mode

00010: Combined regular simultaneous + alternate trigger mode

00011: Combined Interleaved mode + injected simultaneous mode

00100: Reserved

00101: Injected simultaneous mode only

00110: Regular simultaneous mode only

00111: Interleaved mode only

01001: Alternate trigger mode only

All other combinations are reserved and must not be programmed

*Note: The software is allowed to write these bits only when the ADCs are disabled (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).*

**Table 119. DELAY bits versus ADC resolution**

| DELAY bits | 12-bit resolution         | 10-bit resolution         | 8-bit resolution         | 6-bit resolution         |
|------------|---------------------------|---------------------------|--------------------------|--------------------------|
| 0000       | 1 * T <sub>ADC_CLK</sub>  | 1 * T <sub>ADC_CLK</sub>  | 1 * T <sub>ADC_CLK</sub> | 1 * T <sub>ADC_CLK</sub> |
| 0001       | 2 * T <sub>ADC_CLK</sub>  | 2 * T <sub>ADC_CLK</sub>  | 2 * T <sub>ADC_CLK</sub> | 2 * T <sub>ADC_CLK</sub> |
| 0010       | 3 * T <sub>ADC_CLK</sub>  | 3 * T <sub>ADC_CLK</sub>  | 3 * T <sub>ADC_CLK</sub> | 3 * T <sub>ADC_CLK</sub> |
| 0011       | 4 * T <sub>ADC_CLK</sub>  | 4 * T <sub>ADC_CLK</sub>  | 4 * T <sub>ADC_CLK</sub> | 4 * T <sub>ADC_CLK</sub> |
| 0100       | 5 * T <sub>ADC_CLK</sub>  | 5 * T <sub>ADC_CLK</sub>  | 5 * T <sub>ADC_CLK</sub> | 5 * T <sub>ADC_CLK</sub> |
| 0101       | 6 * T <sub>ADC_CLK</sub>  | 6 * T <sub>ADC_CLK</sub>  | 6 * T <sub>ADC_CLK</sub> | 6 * T <sub>ADC_CLK</sub> |

| r               | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:16 **RDATA\_SLV[15:0]**: Regular data of the slave ADC

In dual mode, these bits contain the regular data of the slave ADC. Refer to [Section 18.4.31: Dual ADC modes](#).

The data alignment is applied as described in [Section : Data register, data alignment and offset \(ADC\\_DR, OFFSETy, OFFSETy\\_CH, ALIGN\)](#)

Bits 15:0 **RDATA\_MST[15:0]**: Regular data of the master ADC.

In dual mode, these bits contain the regular data of the master ADC. Refer to [Section 18.4.31: Dual ADC modes](#).

The data alignment is applied as described in [Section : Data register, data alignment and offset \(ADC\\_DR, OFFSETy, OFFSETy\\_CH, ALIGN\)](#)

In MDMA = 11 mode, bits 15:8 contains SLV\_ADC\_DR[7:0], bits 7:0 contains MST\_ADC\_DR[7:0].

## 18.9 ADC register map

The following table summarizes the ADC registers.

**Table 120. ADC global register map**

| Offset        | Register                               |
|---------------|----------------------------------------|
| 0x000 - 0x0B4 | Master ADC1                            |
| 0x0B8 - 0x0FC | Reserved                               |
| 0x100 - 0x1B4 | Slave ADC2                             |
| 0x1B8 - 0x1FC | Reserved                               |
| 0x200 - 0x2B4 | Single ADC3                            |
| 0x2B8 - 0x2FC | Reserved                               |
| 0x300 - 0x30C | Master and slave ADCs common registers |

**Table 121. ADC register map and reset values for each ADC (offset = 0x000 for master ADC, 0x100 for slave ADC)**

| Offset | Register name<br>reset value | 31      | 30          | 29      | 28         | 27        | 26          | 25      | 24          | 23       | 22          | 21      | 20            | 19   | 18          | 17   | 16                  | 15   | 14          | 13        | 12          | 11     | 10          | 9         | 8         | 7       | 6       | 5          | 4         | 3         | 2        | 1        | 0     |      |  |  |  |  |

## 19 Digital-to-analog converter (DAC)

### 19.1 Introduction

The DAC module is a 12-bit, voltage output digital-to-analog converter. The DAC can be configured in 8- or 12-bit mode and may be used in conjunction with the DMA controller. In 12-bit mode, the data can be left- or right-aligned. The DAC features two output channels, each with its own converter. In dual DAC channel mode, conversions can be done independently or simultaneously when both channels are grouped together for synchronous update operations. An input reference pin,  $V_{REF+}$  (shared with others analog peripherals) is available for better resolution. An internal reference can also be set on the same input. Refer to *voltage reference buffer (VREFBUF)* section.

The DACx\_OUTy pin can be used as general purpose input/output (GPIO) when the DAC output is disconnected from output pad and connected to on chip peripheral. The DAC output buffer can be optionally enabled to obtain a high drive output current. An individual calibration can be applied on each DAC output channel. The DAC output channels support a low power mode, the Sample and hold mode.

### 19.2 DAC main features

The DAC main features are the following (see [Figure 137: Dual-channel DAC block diagram](#))

- One DAC interface, maximum two output channels
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave and Triangular-wave generation
- Dual DAC channel for independent or simultaneous conversions
- DMA capability for each channel including DMA underrun error detection
- External triggers for conversion
- DAC output channel buffered/unbuffered modes
- Buffer offset calibration
- Each DAC output can be disconnected from the DACx\_OUTy output pin
- DAC output connection to on-chip peripherals
- Sample and hold mode for low power operation in Stop mode
- Input voltage reference from  $V_{REF+}$  pin or internal VREFBUF reference

[Figure 137](#) shows the block diagram of a DAC channel and [Table 124](#) gives the pin description.

## 19.3 DAC implementation

Table 123. DAC features

| DAC features          | DAC1                               |
|-----------------------|------------------------------------|
| Dual channel          | X                                  |
| Output buffer         | X                                  |
| I/O connection        | DAC1_OUT1 on PA4, DAC1_OUT2 on PA5 |
| Maximum sampling time | 1 Msps                             |
| Autonomous mode       | -                                  |
| VREF+ pin             | X                                  |

## 19.4 DAC functional description

### 19.4.1 DAC block diagram

Figure 137. Dual-channel DAC block diagram

1. MODEx bits in the DAC\_MCR control the output mode and allow switching between the Normal mode in buffer/unbuffered configuration and the Sample and hold mode.
2. Refer to [Section 19.3: DAC implementation](#) for channel2 availability.

The DAC includes:

- Up to two output channels
- The DACx\_OUTy can be disconnected from the output pin and used as an ordinary GPIO
- The DAC\_OUTx can use an internal pin connection to on-chip peripherals such as comparator, operational amplifier and ADC (if available).
- DAC output channel buffered or non buffered
- Sample and hold block and registers operational in Stop mode, using the LSI clock source for static conversion.

The DAC includes up to two separate output channels. Each output channel can be connected to on-chip peripherals such as comparator, operational amplifier and ADC (if available). In this case, the DAC output channel can be disconnected from the DACx\_OUTy output pin and the corresponding GPIO can be used for another purpose.

The DAC output can be buffered or not. The Sample and hold block and its associated registers can run in Stop mode using the LSI clock source.

**Table 124. DAC input/output pins**

| Pin name  | Signal type                      | Remarks                                                                                            |
|-----------|----------------------------------|----------------------------------------------------------------------------------------------------|
| VREF+     | Input, analog reference positive | The higher/positive reference voltage for the DAC, $V_{REF+} \leq V_{DDAmax}$ (refer to datasheet) |
| VDDA      | Input, analog supply             | Analog power supply                                                                                |
| VSSA      | Input, analog supply ground      | Ground for analog power supply                                                                     |
| DACx_OUTy | Analog output signal             | DACx channely analog output                                                                        |

#### 19.4.2 DAC channel enable

Each DAC channel can be powered on by setting its corresponding ENx bit in the DAC\_CR register. The DAC channel is then enabled after a  $t_{WAKEUP}$  startup time.

*Note:* The ENx bit enables the analog DAC channelx only. The DAC channelx digital interface is enabled even if the ENx bit is reset.

#### 19.4.3 DAC data format

Depending on the selected configuration mode, the data have to be written into the specified register as described below:

- Single DAC channel  
There are three possibilities:
  - 8-bit right alignment: the software has to load data into the DAC\_DHR8Rx[7:0] bits (stored into the DHRx[11:4] bits)
  - 12-bit left alignment: the software has to load data into the DAC\_DHR12Lx [15:4] bits (stored into the DHRx[11:0] bits)
  - 12-bit right alignment: the software has to load data into the DAC\_DHR12Rx [11:0] bits (stored into the DHRx[11:0] bits)

Depending on the loaded DAC\_DHRyyyx register, the data written by the user is shifted and stored into the corresponding DHRx (data holding registerx, which are internal non-memory-

mapped registers). The DHRx register is then loaded into the DORx register either automatically, by software trigger or by an external event trigger.

**Figure 138. Data registers in single DAC channel mode**

- Dual DAC channels (when available)  
There are three possibilities:
  - 8-bit right alignment: data for DAC channel1 to be loaded into the DAC\_DHR8RD [7:0] bits (stored into the DHR1[11:4] bits) and data for DAC channel2 to be loaded into the DAC\_DHR8RD [15:8] bits (stored into the DHR2[11:4] bits)
  - 12-bit left alignment: data for DAC channel1 to be loaded into the DAC\_DHR12LD [15:4] bits (stored into the DHR1[11:0] bits) and data for DAC channel2 to be loaded into the DAC\_DHR12LD [31:20] bits (stored into the DHR2[11:0] bits)
  - 12-bit right alignment: data for DAC channel1 to be loaded into the DAC\_DHR12RD [11:0] bits (stored into the DHR1[11:0] bits) and data for DAC channel2 to be loaded into the DAC\_DHR12RD [27:16] bits (stored into the DHR2[11:0] bits)

Depending on the loaded DAC\_DHRyyyD register, the data written by the user is shifted and stored into DHR1 and DHR2 (data holding registers, which are internal non-memory-mapped registers). The DHR1 and DHR2 registers are then loaded into the DAC\_DOR1 and DOR2 registers, respectively, either automatically, by software trigger or by an external event trigger.

**Figure 139. Data registers in dual DAC channel mode**

### 19.4.4 DAC conversion

The DAC\_DORx cannot be written directly and any data transfer to the DAC channelx must be performed by loading the DAC\_DHRx register (write operation to DAC\_DHR8Rx, DAC\_DHR12Lx, DAC\_DHR12Rx, DAC\_DHR8RD, DAC\_DHR12RD or DAC\_DHR12LD).

Data stored in the DAC\_DHRx register are automatically transferred to the DAC\_DORx register after one APB1 clock cycle, if no hardware trigger is selected (TENx bit in DAC\_CR register is reset). However, when a hardware trigger is selected (TENx bit in DAC\_CR register is set) and a trigger occurs, the transfer is performed three APB1 clock cycles after the trigger signal.

When DAC\_DORx is loaded with the DAC\_DHRx contents, the analog output voltage becomes available after a time  $t_{\text{SETTLING}}$  that depends on the power supply voltage and the analog output load.

**Figure 140. Timing diagram for conversion with trigger disabled TEN = 0**

### 19.4.5 DAC output voltage

Digital inputs are converted to output voltages on a linear conversion between 0 and  $V_{\text{REF}+}$ .

The analog output voltages on each DAC channel pin are determined by the following equation:

$$\text{DACoutput} = V_{\text{REF}} \times \frac{\text{DOR}}{4096}$$

### 19.4.6 DAC trigger selection

If the TENx control bit is set, the conversion can then be triggered by an external event (timer counter, external interrupt line). The TSELx[2:0] control bits determine which out of 8 possible events triggers the conversion as shown in TSELx[2:0] bits of the DAC\_CR register. These events can be either the software trigger or hardware triggers.

Each time a DAC interface detects a rising edge on the selected trigger source (refer to the table below), the last data stored into the DAC\_DHRx register are transferred into the DAC\_DORx register. The DAC\_DORx register is updated three APB1 cycles after the trigger occurs.

If the software trigger is selected, the conversion starts once the SWTRIG bit is set. SWTRIG is reset by hardware once the DAC\_DORx register has been loaded with the DAC\_DHRx register contents.

*Note:* TSELx[2:0] bit cannot be changed when the ENx bit is set.

When software trigger is selected, the transfer from the DAC\_DHRx register to the DAC\_DORx register takes only one APB1 clock cycle.

**Table 125. DAC trigger selection**

| Source    | Type                                | TSELx[2:0] |
|-----------|-------------------------------------|------------|
| TIM6_TRGO | Internal signal from on-chip timers | 000        |
| TIM8_TRGO | Internal signal from on-chip timers | 001        |
| TIM7_TRGO | Internal signal from on-chip timers | 010        |
| TIM5_TRGO | Internal signal from on-chip timers | 011        |
| TIM2_TRGO | Internal signal from on-chip timers | 100        |
| TIM4_TRGO | Internal signal from on-chip timers | 101        |
| EXTI9     | External pin                        | 110        |
| SWTRIG    | Software control bit                | 111        |

#### 19.4.7 DMA requests

Each DAC channel has a DMA capability. Two DMA channels are used to service DAC channel DMA requests.

When an external trigger (but not a software trigger) occurs while the DMAENx bit is set, the value of the DAC\_DHRx register is transferred into the DAC\_DORx register when the transfer is complete, and a DMA request is generated.

In dual mode, if both DMAENx bits are set, two DMA requests are generated. If only one DMA request is needed, only the corresponding DMAENx bit must be set. In this way, the application can manage both DAC channels in dual mode by using one DMA request and a unique DMA channel.

As DAC\_DHRx to DAC\_DORx data transfer occurred before the DMA request, the very first data has to be written to the DAC\_DHRx before the first trigger event occurs.

##### DMA underrun

The DAC DMA request is not queued so that if a second external trigger arrives before the acknowledgment for the first external trigger is received (first request), then no new request is issued and the DMA channelx underrun flag DMAUDRx in the DAC\_SR register is set, reporting the error condition. The DAC channelx continues to convert old data.

The software must clear the DMAUDRx flag by writing 1, clear the DMAEN bit of the used DMA stream and re-initialize both DMA and DAC channelx to restart the transfer correctly. The software must modify the DAC trigger conversion frequency or lighten the DMA workload to avoid a new DMA underrun. Finally, the DAC conversion can be resumed by enabling both DMA data transfer and conversion trigger.

For each DAC channelx, an interrupt is also generated if its corresponding DMAUDRIEx bit in the DAC\_CR register is enabled.

### 19.4.8 Noise generation

In order to generate a variable-amplitude pseudonoise, an LFSR (linear feedback shift register) is available. DAC noise generation is selected by setting WAVEx[1:0] to 01. The preloaded value in LFSR is 0xAAA. This register is updated three APB1 clock cycles after each trigger event, following a specific calculation algorithm.

Figure 141. DAC LFSR register calculation algorithm

The LFSR value, that may be masked partially or totally by means of the MAMPx[3:0] bits in the DAC\_CR register, is added up to the DAC\_DHRx contents without overflow and this value is then transferred into the DAC\_DORx register.

If LFSR is 0x0000, a '1' is injected into it (antilock-up mechanism).

It is possible to reset LFSR wave generation by resetting the WAVEx[1:0] bits.

Figure 142. DAC conversion (SW trigger enabled) with LFSR wave generation

**Note:** The DAC trigger must be enabled for noise generation by setting the TENx bit in the DAC\_CR register.

### 19.4.9 Triangle-wave generation

It is possible to add a small-amplitude triangular waveform on a DC or slowly varying signal. DAC triangle-wave generation is selected by setting `WAVEx[1:0]` to `10`". The amplitude is configured through the `MAMPx[3:0]` bits in the `DAC_CR` register. An internal triangle counter is incremented three APB1 clock cycles after each trigger event. The value of this counter is then added to the `DAC_DHRx` register without overflow and the sum is transferred into the `DAC_DORx` register. The triangle counter is incremented as long as it is less than the maximum amplitude defined by the `MAMPx[3:0]` bits. Once the configured amplitude is reached, the counter is decremented down to 0, then incremented again and so on.

It is possible to reset triangle wave generation by resetting the `WAVEx[1:0]` bits.

**Figure 143. DAC triangle wave generation**

**Figure 144. DAC conversion (SW trigger enabled) with triangle wave generation**

**Note:** The DAC trigger must be enabled for triangle wave generation by setting the `TENx` bit in the `DAC_CR` register.

The `MAMPx[3:0]` bits must be configured before enabling the DAC, otherwise they cannot be changed.

### 19.4.10 DAC channel modes

Each DAC channel can be configured in Normal mode or Sample and hold mode. The output buffer can be enabled to obtain a high drive capability. Before enabling output buffer, the voltage offset needs to be calibrated. This calibration is performed at the factory (loaded after reset) and can be adjusted by software during application operation.

#### Normal mode

In Normal mode, there are four combinations, by changing the buffer state and by changing the DACx\_OUTy pin interconnections.

To enable the output buffer, the MODEx[2:0] bits in DAC\_MCR register must be:

- 000: DAC is connected to the external pin
- 001: DAC is connected to external pin and to on-chip peripherals

To disable the output buffer, the MODEx[2:0] bits in DAC\_MCR register must be:

- 010: DAC is connected to the external pin
- 011: DAC is connected to on-chip peripherals

#### Sample and hold mode

In Sample and hold mode, the DAC core converts data on a triggered conversion, and then holds the converted voltage on a capacitor. When not converting, the DAC cores and buffer are completely turned off between samples and the DAC output is tri-stated, therefore reducing the overall power consumption. A stabilization period, which value depends on the buffer state, is required before each new conversion.

In this mode, the DAC core and all corresponding logic and registers are driven by the LSI low-speed clock in addition to the APB1 clock, allowing using the DAC channels in deep low power modes such as Stop mode.

The LSI low-speed clock must not be stopped when the Sample and hold mode is enabled.

The sample/hold mode operations can be divided into 3 phases:

1. Sample phase: the sample/hold element is charged to the desired voltage. The charging time depends on capacitor value (internal or external, selected by the user). The sampling time is configured with the TSAMPLEx[9:0] bits in DAC\_SHSRx register. During the write of the TSAMPLEx[9:0] bits, the BWSTx bit in DAC\_SR register is set to 1 to synchronize between both clocks domains (APB and low speed clock) and allowing the software to change the value of sample phase during the DAC channel operation
2. Hold phase: the DAC output channel is tri-stated, the DAC core and the buffer are turned off, to reduce the current consumption. The hold time is configured with the THOLDx[9:0] bits in DAC\_SHHR register
3. Refresh phase: the refresh time is configured with the TREFRESHx[7:0] bits in DAC\_SHRR register

The timings for the three phases above are in units of LSI clock periods. As an example, to configure a sample time of 350  $\mu$ s, a hold time of 2 ms and a refresh time of 100  $\mu$ s assuming LSI ~32 KHz is selected:

12 cycles are required for sample phase: TSAMPLEx[9:0] = 11,

62 cycles are required for hold phase: THOLDx[9:0] = 62,

and 4 cycles are required for refresh period: TREFRESHx[7:0] = 4.

In this example, the power consumption is reduced by almost a factor of 15 versus Normal modes.

The formulas to compute the right sample and refresh timings are described in the table below, the Hold time depends on the leakage current.

**Table 126. Sample and refresh timings**

| Buffer State | $t_{\text{SAMP}}^{(1)(2)}$                                       | $t_{\text{REFRESH}}^{(2)(3)}$                                                             |
|--------------|------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| Enable       | $7 \mu\text{s} + (10 \cdot R_{\text{BON}} \cdot C_{\text{SH}})$  | $7 \mu\text{s} + (R_{\text{BON}} \cdot C_{\text{SH}}) \cdot \ln(2 \cdot N_{\text{LSB}})$  |
| Disable      | $3 \mu\text{s} + (10 \cdot R_{\text{BOFF}} \cdot C_{\text{SH}})$ | $3 \mu\text{s} + (R_{\text{BOFF}} \cdot C_{\text{SH}}) \cdot \ln(2 \cdot N_{\text{LSB}})$ |

1. In the above formula the settling to the desired code value with  $\frac{1}{2}$  LSB or accuracy requires 10 constant time for 12 bits resolution. For 8 bits resolution, the settling time is 7 constant time.
2.  $C_{\text{SH}}$  is the capacitor in Sample and hold mode.
3. The tolerated voltage drop during the hold phase "Vd" is represented by the number of LSBs after the capacitor discharging with the output leakage current. The settling back to the desired value with  $\frac{1}{2}$  LSB error accuracy requires  $\ln(2 \cdot N_{\text{LSB}})$  constant time of the DAC.

### Example of the sample and refresh time calculation with output buffer on

The values used in the example below are provided as indication only. Refer to the product datasheet for product data.

$$C_{\text{SH}} = 100 \text{ nF}$$

$$V_{\text{DDA}} = 3.0 \text{ V}$$

Sampling phase:

$$t_{\text{SAMP}} = 7 \mu\text{s} + (10 \cdot 2000 \cdot 100 \cdot 10^{-9}) = 2.007 \text{ ms}$$

(where  $R_{\text{BON}} = 2 \text{ k}\Omega$ )

Refresh phase:

$$t_{\text{REFRESH}} = 7 \mu\text{s} + (2000 \cdot 100 \cdot 10^{-9}) \cdot \ln(2 \cdot 10) = 606.1 \mu\text{s}$$

(where  $N_{\text{LSB}} = 10$  (10 LSB drop during the hold phase))

Hold phase:

$$D_v = i_{\text{leak}} \cdot t_{\text{hold}} / C_{\text{SH}} = 0.0073 \text{ V (10 LSB of 12bit at 3 V)}$$

$$i_{\text{leak}} = 150 \text{ nA (worst case on the IO leakage on all the temperature range)}$$

$$t_{\text{hold}} = 0.0073 \cdot 100 \cdot 10^{-9} / (150 \cdot 10^{-9}) = 4.867 \text{ ms}$$

Figure 145. DAC Sample and hold mode phase diagram

Like in Normal mode, the Sample and hold mode has different configurations.

To enable the output buffer, `MODEx[2:0]` bits in `DAC_MCR` register must be set to:

- 100: DAC is connected to the external pin
- 101: DAC is connected to external pin and to on chip peripherals

To disabled the output buffer, `MODEx[2:0]` bits in `DAC_MCR` register must be set to:

- 110: DAC is connected to external pin and to on chip peripherals
- 111: DAC is connected to on chip peripherals

When `MODEx[2:0]` bits are equal to 111, an internal capacitor,  $C_{Lint}$ , holds the voltage output of the DAC core and then drive it to on-chip peripherals.

All Sample and hold phases are interruptible, and any change in `DAC_DHRx` immediately triggers a new sample phase.

Table 127. Channel output modes summary

| MODEx[2:0] |   |   | Mode        | Buffer   | Output connections                                                         |
|------------|---|---|-------------|----------|----------------------------------------------------------------------------|
| 0          | 0 | 0 | Normal mode | Enabled  | Connected to external pin                                                  |
| 0          | 0 | 1 |             |          | Connected to external pin and to on chip-peripherals (such as comparators) |
| 0          | 1 | 0 |             | Disabled | Connected to external pin                                                  |
| 0          | 1 | 1 |             |          | Connected to on chip peripherals (such as comparators)                     |

### 19.4.11 DAC channel buffer calibration

The transfer function for an N-bit digital-to-analog converter (DAC) is:

$$V_{out} = ((D / 2^N) \times G \times V_{ref}) + V_{OS}$$

Where  $V_{OUT}$  is the analog output, D is the digital input, G is the gain,  $V_{ref}$  is the nominal full-scale voltage, and  $V_{os}$  is the offset voltage. For an ideal DAC channel,  $G = 1$  and  $V_{os} = 0$ .

Due to output buffer characteristics, the voltage offset may differ from part-to-part and introduce an absolute offset error on the analog output. To compensate the  $V_{os}$ , a calibration is required by a trimming technique.

The calibration is only valid when the DAC channelx is operating with buffer enabled (MODEx[2:0] = 0b000 or 0b001 or 0b100 or 0b101). if applied in other modes when the buffer is off, it has no effect. During the calibration:

- The buffer output is disconnected from the pin internal/external connections and put in tristate mode (HiZ).
- The buffer acts as a comparator to sense the middle-code value 0x800 and compare it to  $V_{REF}/2$  signal through an internal bridge, then toggle its output signal to 0 or 1 depending on the comparison result (CAL\_FLAGx bit).

Two calibration techniques are provided:

- **Factory trimming (default setting)**  
The DAC buffer offset is factory trimmed. The default value of OTRIMx[4:0] bits in DAC\_CCR register is the factory trimming value and it is loaded once DAC digital interface is reset.
- **User trimming**  
The user trimming can be done when the operating conditions differs from nominal factory trimming conditions and in particular when  $V_{DDA}$  voltage, temperature,  $V_{REF+}$  values change and can be done at any point during application by software.

**Note:** Refer to the datasheet for more details of the Nominal factory trimming conditions

In addition, when  $V_{DD}$  is removed (example the device enters in STANDBY or VBAT modes) the calibration is required.

The steps to perform a user trimming calibration are as below:

1. If the DAC channel is active, write 0 to ENx bit in DAC\_CR to disable the channel.
2. Select a mode where the buffer is enabled, by writing to DAC\_MCR register, MODEx[2:0] = 0b000 or 0b001 or 0b100 or 0b101.
3. Start the DAC channelx calibration, by setting the CENx bit in DAC\_CR register to 1.
4. Apply a trimming algorithm:
  - a) Write a code into OTRIMx[4:0] bits, starting by 0b00000.
  - b) Wait for  $t_{TRIM}$  delay.
  - c) Check if CAL\_FLAGx bit in DAC\_SR is set to 1.
  - d) If CAL\_FLAGx is set to 1, the OTRIMx[4:0] trimming code is found and can be used during device operation to compensate the output value, else increment OTRIMx[4:0] and repeat sub-steps from (a) to (d) again.

The software algorithm may use either a successive approximation or dichotomy techniques to compute and set the content of OTRIMx[4:0] bits in a faster way.

The commutation/toggle of CAL\_FLAGx bit indicates that the offset is correctly compensated and the corresponding trim code must be kept in the OTRIMx[4:0] bits in DAC\_CCR register.

**Note:** *A  $t_{TRIM}$  delay must be respected between the write to the OTRIMx[4:0] bits and the read of the CAL\_FLAGx bit in DAC\_SR register in order to get a correct value. This parameter is specified into datasheet electrical characteristics section.*

*If  $V_{DDA}$ , VREF+ and temperature conditions do not change during device operation while it enters more often in standby and VBAT mode, the software may store the OTRIMx[4:0] bits found in the first user calibration in the flash or in back-up registers. then to load/write them directly when the device power is back again thus avoiding to wait for a new calibration time.*

*When CENx bit is set, it is not allowed to set ENx bit.*

#### 19.4.12 Dual DAC channel conversion modes (if dual channels are available)

To efficiently use the bus bandwidth in applications that require the two DAC channels at the same time, three dual registers are implemented: DHR8RD, DHR12RD and DHR12LD. A unique register access is then required to drive both DAC channels at the same time. For the wave generation, no accesses to DHRxxxD registers are required. As a result, two output channels can be used either independently or simultaneously.

11 conversion modes are possible using the two DAC channels and these dual registers. All the conversion modes can nevertheless be obtained using separate DHRx registers if needed.

All modes are described in the paragraphs below.

##### Independent trigger without wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a DAC channel1 trigger arrives, the DHR1 register is transferred into DAC\_DOR1 (three APB1 clock cycles later).

When a DAC channel2 trigger arrives, the DHR2 register is transferred into DAC\_DOR2 (three APB1 clock cycles later).

### Independent trigger with single LFSR generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 01 and the same LFSR mask value in the MAMPx[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a DAC channel1 trigger arrives, the LFSR1 counter, with the same mask, is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB1 clock cycles later). Then the LFSR1 counter is updated.

When a DAC channel2 trigger arrives, the LFSR2 counter, with the same mask, is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three APB1 clock cycles later). Then the LFSR2 counter is updated.

### Independent trigger with different LFSR generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 01 and set different LFSR masks values in the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a DAC channel1 trigger arrives, the LFSR1 counter, with the mask configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB1 clock cycles later). Then the LFSR1 counter is updated.

When a DAC channel2 trigger arrives, the LFSR2 counter, with the mask configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three APB1 clock cycles later). Then the LFSR2 counter is updated.

### Independent trigger with single triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and the same maximum amplitude value in the MAMPx[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a DAC channel1 trigger arrives, the DAC channel1 triangle counter, with the same triangle amplitude, is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB1 clock cycles later). The DAC channel1 triangle counter is then updated.

When a DAC channel2 trigger arrives, the DAC channel2 triangle counter, with the same triangle amplitude, is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three APB1 clock cycles later). The DAC channel2 triangle counter is then updated.

### Independent trigger with different triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bits.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and set different maximum amplitude values in the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a DAC channel1 trigger arrives, the DAC channel1 triangle counter, with a triangle amplitude configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB1 clock cycles later). The DAC channel1 triangle counter is then updated.

When a DAC channel2 trigger arrives, the DAC channel2 triangle counter, with a triangle amplitude configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three APB1 clock cycles later). The DAC channel2 triangle counter is then updated.

### Simultaneous software start

To configure the DAC in this conversion mode, the following sequence is required:

- Load the dual DAC channel data to the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

In this configuration, one APB1 clock cycle later, the DHR1 and DHR2 registers are transferred into DAC\_DOR1 and DAC\_DOR2, respectively.

### Simultaneous trigger without wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Load the dual DAC channel data to the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a trigger arrives, the DHR1 and DHR2 registers are transferred into DAC\_DOR1 and DAC\_DOR2, respectively (after three APB1 clock cycles).

#### **Simultaneous trigger with single LFSR generation**

1. To configure the DAC in this conversion mode, the following sequence is required:
2. Set the two DAC channel trigger enable bits TEN1 and TEN2.
3. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
4. Configure the two DAC channel WAVEx[1:0] bits as 01 and the same LFSR mask value in the MAMPx[3:0] bits.
5. Load the dual DAC channel data to the desired DHR register (DHR12RD, DHR12LD or DHR8RD).

When a trigger arrives, the LFSR1 counter, with the same mask, is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB1 clock cycles later). The LFSR1 counter is then updated. At the same time, the LFSR2 counter, with the same mask, is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three APB1 clock cycles later). The LFSR2 counter is then updated.

#### **Simultaneous trigger with different LFSR generation**

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 01 and set different LFSR mask values using the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a trigger arrives, the LFSR1 counter, with the mask configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB1 clock cycles later). The LFSR1 counter is then updated.

At the same time, the LFSR2 counter, with the mask configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three APB1 clock cycles later). The LFSR2 counter is then updated.

#### **Simultaneous trigger with single triangle generation**

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and the same maximum amplitude value using the MAMPx[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a trigger arrives, the DAC channel1 triangle counter, with the same triangle amplitude, is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB1 clock cycles later). The DAC channel1 triangle counter is then updated.

At the same time, the DAC channel2 triangle counter, with the same triangle amplitude, is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three APB1 clock cycles later). The DAC channel2 triangle counter is then updated.

### Simultaneous trigger with different triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and set different maximum amplitude values in the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a trigger arrives, the DAC channel1 triangle counter, with a triangle amplitude configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB clock cycles later). Then the DAC channel1 triangle counter is updated.

At the same time, the DAC channel2 triangle counter, with a triangle amplitude configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three APB1 clock cycles later). Then the DAC channel2 triangle counter is updated.

## 19.5 DAC in low-power modes

Table 128. Effect of low-power modes on DAC

| Mode            | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| Sleep           | No effect, DAC used with DMA                                                                        |
| Low-power run   | No effect.                                                                                          |
| Low-power sleep | No effect. DAC used with DMA.                                                                       |
| Stop 0 / Stop 1 | The DAC remains active with a static value if the Sample and hold mode is selected using LSI clock. |
| Stop 2          | The DAC registers content is kept. The DAC must be disabled before entering Stop 2.                 |

Table 128. Effect of low-power modes on DAC (continued)

| Mode     | Description                                                                                          |
|----------|------------------------------------------------------------------------------------------------------|
| Standby  | The DAC peripheral is powered down and must be reinitialized after exiting Standby or Shutdown mode. |
| Shutdown |                                                                                                      |

## 19.6 DAC interrupts

Table 129. DAC interrupts

| Interrupt acronym | Interrupt event | Event flag | Enable control bit | Interrupt clear method | Exit Sleep mode | Exit Stop mode | Exit Standby mode |
|-------------------|-----------------|------------|--------------------|------------------------|-----------------|----------------|-------------------|
| DAC               | DMA underrun    | DMAUDRx    | DMAUDRIEx          | Write DMAUDRx = 1      | Yes             | No             | No                |

## 19.7 DAC registers

Refer to [Section 1 on page 69](#) for a list of abbreviations used in register descriptions.

The peripheral registers have to be accessed by words (32-bit).

### 19.7.1 DAC control register (DAC\_CR)

Bit 31 Reserved, must be kept at reset value.

Bit 30 **CEN2**: DAC channel2 calibration enable

This bit is set and cleared by software to enable/disable DAC channel2 calibration, it can be written only if EN2 bit is set to 0 into DAC\_CR (the calibration mode can be entered/exit only when the DAC channel is disabled) Otherwise, the write operation is ignored.

0: DAC channel2 in Normal operating mode

1: DAC channel2 in calibration mode

*Note: This bit is available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).*

Bit 29 **DMAUDRIE2**: DAC channel2 DMA underrun interrupt enable

This bit is set and cleared by software.

0: DAC channel2 DMA underrun interrupt disabled

1: DAC channel2 DMA underrun interrupt enabled

*Note: This bit is available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).*

Bit 28 **DMAEN2**: DAC channel2 DMA enable

This bit is set and cleared by software.

0: DAC channel2 DMA mode disabled

1: DAC channel2 DMA mode enabled

*Note: This bit is available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).*

Bits 27:24 **MAMP2[3:0]**: DAC channel2 mask/amplitude selector

These bits are written by software to select mask in wave generation mode or amplitude in triangle generation mode.

0000: Unmask bit0 of LFSR/ triangle amplitude equal to 1

0001: Unmask bits[1:0] of LFSR/ triangle amplitude equal to 3

0010: Unmask bits[2:0] of LFSR/ triangle amplitude equal to 7

0011: Unmask bits[3:0] of LFSR/ triangle amplitude equal to 15

0100: Unmask bits[4:0] of LFSR/ triangle amplitude equal to 31

0101: Unmask bits[5:0] of LFSR/ triangle amplitude equal to 63

0110: Unmask bits[6:0] of LFSR/ triangle amplitude equal to 127

0111: Unmask bits[7:0] of LFSR/ triangle amplitude equal to 255

1000: Unmask bits[8:0] of LFSR/ triangle amplitude equal to 511

1001: Unmask bits[9:0] of LFSR/ triangle amplitude equal to 1023

1010: Unmask bits[10:0] of LFSR/ triangle amplitude equal to 2047

≥ 1011: Unmask bits[11:0] of LFSR/ triangle amplitude equal to 4095

*Note:* These bits are available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).

Bits 23:22 **WAVE2[1:0]**: DAC channel2 noise/triangle wave generation enable

These bits are set/reset by software.

00: wave generation disabled

01: Noise wave generation enabled

1x: Triangle wave generation enabled

*Note:* Only used if bit *TEN2* = 1 (DAC channel2 trigger enabled)

These bits are available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).

Bits 21:19 **TSEL2[2:0]**: DAC channel2 trigger selection

These bits select the external event used to trigger DAC channel2

Refer to the trigger selection tables in [Section 19.4.6: DAC trigger selection](#) for details on trigger configuration and mapping.

*Note:* Only used if bit *TEN2* = 1 (DAC channel2 trigger enabled).

These bits are available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).

Bit 18 **TEN2**: DAC channel2 trigger enable

This bit is set and cleared by software to enable/disable DAC channel2 trigger

0: DAC channel2 trigger disabled and data written into the DAC\_DHR2 register are transferred one APB1 clock cycle later to the DAC\_DOR2 register

1: DAC channel2 trigger enabled and data from the DAC\_DHR2 register are transferred three APB1 clock cycles later to the DAC\_DOR2 register

*Note:* When software trigger is selected, the transfer from the DAC\_DHR2 register to the DAC\_DOR2 register takes only one APB1 clock cycle.

These bits are available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).

Bit 17 Reserved, must be kept at reset value.

Bit 16 **EN2**: DAC channel2 enable

This bit is set and cleared by software to enable/disable DAC channel2.

0: DAC channel2 disabled

1: DAC channel2 enabled

*Note:* These bits are available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).

Bit 15 Reserved, must be kept at reset value.

Bit 14 **CEN1**: DAC channel1 calibration enable

This bit is set and cleared by software to enable/disable DAC channel1 calibration, it can be written only if bit EN1 = 0 into DAC\_CR (the calibration mode can be entered/exit only when the DAC channel is disabled) Otherwise, the write operation is ignored.

0: DAC channel1 in Normal operating mode  
1: DAC channel1 in calibration mode

Bit 13 **DMAUDRIE1**: DAC channel1 DMA Underrun Interrupt enable

This bit is set and cleared by software.

0: DAC channel1 DMA Underrun Interrupt disabled  
1: DAC channel1 DMA Underrun Interrupt enabled

Bit 12 **DMAEN1**: DAC channel1 DMA enable

This bit is set and cleared by software.

0: DAC channel1 DMA mode disabled  
1: DAC channel1 DMA mode enabled

Bits 11:8 **MAMP1[3:0]**: DAC channel1 mask/amplitude selector

These bits are written by software to select mask in wave generation mode or amplitude in triangle generation mode.

0000: Unmask bit0 of LFSR/ triangle amplitude equal to 1  
0001: Unmask bits[1:0] of LFSR/ triangle amplitude equal to 3  
0010: Unmask bits[2:0] of LFSR/ triangle amplitude equal to 7  
0011: Unmask bits[3:0] of LFSR/ triangle amplitude equal to 15  
0100: Unmask bits[4:0] of LFSR/ triangle amplitude equal to 31  
0101: Unmask bits[5:0] of LFSR/ triangle amplitude equal to 63  
0110: Unmask bits[6:0] of LFSR/ triangle amplitude equal to 127  
0111: Unmask bits[7:0] of LFSR/ triangle amplitude equal to 255  
1000: Unmask bits[8:0] of LFSR/ triangle amplitude equal to 511  
1001: Unmask bits[9:0] of LFSR/ triangle amplitude equal to 1023  
1010: Unmask bits[10:0] of LFSR/ triangle amplitude equal to 2047  
≥ 1011: Unmask bits[11:0] of LFSR/ triangle amplitude equal to 4095

Bits 7:6 **WAVE1[1:0]**: DAC channel1 noise/triangle wave generation enable

These bits are set and cleared by software.

00: wave generation disabled  
01: Noise wave generation enabled  
1x: Triangle wave generation enabled  
Only used if bit TEN1 = 1 (DAC channel1 trigger enabled).

Bits 5:3 **TSEL1[2:0]**: DAC channel1 trigger selection

These bits select the external event used to trigger DAC channel1

Refer to the trigger selection tables in [Section 19.4.6: DAC trigger selection](#) for details on trigger configuration and mapping.

*Note: Only used if bit TEN1 = 1 (DAC channel1 trigger enabled).*

Bit 2 **TEN1**: DAC channel1 trigger enable

This bit is set and cleared by software to enable/disable DAC channel1 trigger.

0: DAC channel1 trigger disabled and data written into the DAC\_DHR1 register are transferred one APB1 clock cycle later to the DAC\_DOR1 register

1: DAC channel1 trigger enabled and data from the DAC\_DHR1 register are transferred three APB1 clock cycles later to the DAC\_DOR1 register

*Note: When software trigger is selected, the transfer from the DAC\_DHR1 register to the DAC\_DOR1 register takes only one APB1 clock cycle.*

Bit 1 Reserved, must be kept at reset value.

Bit 0 **EN1**: DAC channel1 enable

This bit is set and cleared by software to enable/disable DAC channel1.

0: DAC channel1 disabled

1: DAC channel1 enabled

## 19.7.2 DAC software trigger register (DAC\_SWTRGR)

Address offset: 0x04

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      | w       | w       |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SWTRIG2**: DAC channel2 software trigger

This bit is set by software to trigger the DAC in software trigger mode.

0: No trigger

1: Trigger

*Note: This bit is cleared by hardware (one APB1 clock cycle later) once the DAC\_DHR2 register value has been loaded into the DAC\_DOR2 register.*

*This bit is available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).*

Bit 0 **SWTRIG1**: DAC channel1 software trigger

This bit is set by software to trigger the DAC in software trigger mode.

0: No trigger

1: Trigger

*Note: This bit is cleared by hardware (one APB1 clock cycle later) once the DAC\_DHR1 register value has been loaded into the DAC\_DOR1 register.*

### 19.7.3 DAC channel1 12-bit right-aligned data holding register (DAC\_DHR12R1)

Address offset: 0x08

Reset value: 0x0000 0000

| r     | r         | rc_w1    |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15    | 14        | 13       | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| BWST1 | CAL_FLAG1 | DMAU DR1 | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| r     | r         | rc_w1    |      |      |      |      |      |      |      |      |      |      |      |      |      |

**Bit 31 BWST2:** DAC channel2 busy writing sample time flag

This bit is systematically set just after Sample and hold mode enable. It is set each time the software writes the register DAC\_SHSR2, It is cleared by hardware when the write operation of DAC\_SHSR2 is complete. (It takes about 3 LSI periods of synchronization).

0: There is no write operation of DAC\_SHSR2 ongoing: DAC\_SHSR2 can be written

1: There is a write operation of DAC\_SHSR2 ongoing: DAC\_SHSR2 cannot be written

*Note: This bit is available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).*

**Bit 30 CAL\_FLAG2:** DAC channel2 calibration offset status

This bit is set and cleared by hardware

0: calibration trimming value is lower than the offset correction value

1: calibration trimming value is equal or greater than the offset correction value

*Note: This bit is available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).*

**Bit 29 DMAUDR2:** DAC channel2 DMA underrun flag

This bit is set by hardware and cleared by software (by writing it to 1).

0: No DMA underrun error condition occurred for DAC channel2

1: DMA underrun error condition occurred for DAC channel2 (the currently selected trigger is driving DAC channel2 conversion at a frequency higher than the DMA service capability rate).

*Note: This bit is available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).*

Bit 28 Reserved, must be kept at reset value.

Bit 27 Reserved, must be kept at reset value.

Bits 26:16 Reserved, must be kept at reset value.

**Bit 15 BWST1:** DAC channel1 busy writing sample time flag

This bit is systematically set just after Sample and hold mode enable and is set each time the software writes the register DAC\_SHSR1, It is cleared by hardware when the write operation of DAC\_SHSR1 is complete. (It takes about 3 LSI periods of synchronization).

0: There is no write operation of DAC\_SHSR1 ongoing: DAC\_SHSR1 can be written

1: There is a write operation of DAC\_SHSR1 ongoing: DAC\_SHSR1 cannot be written

**Bit 14 CAL\_FLAG1:** DAC channel1 calibration offset status

This bit is set and cleared by hardware

0: calibration trimming value is lower than the offset correction value

1: calibration trimming value is equal or greater than the offset correction value

**Bit 13 DMAUDR1:** DAC channel1 DMA underrun flag

This bit is set by hardware and cleared by software (by writing it to 1).

0: No DMA underrun error condition occurred for DAC channel1

1: DMA underrun error condition occurred for DAC channel1 (the currently selected trigger is driving DAC channel1 conversion at a frequency higher than the DMA service capability rate)

Bit 12 Reserved, must be kept at reset value.

Bit 11 Reserved, must be kept at reset value.

Bits 10:0 Reserved, must be kept at reset value.

### 19.7.15 DAC calibration control register (DAC\_CCR)

Address offset: 0x38

Reset value: 0x00XX 00XX

|      |      |      |      |      |      |      |      |      |      |      |             |    |    |    |    |

|      |      |      |      |      |      |      |      |      |      |      | rw          | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **OTRIM2[4:0]**: DAC channel2 offset trimming value

These bits are available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).

Bits 15:5 Reserved, must be kept at reset value.

Bits 4:0 **OTRIM1[4:0]**: DAC channel1 offset trimming value

### 19.7.16 DAC mode control register (DAC\_MCR)

Address offset: 0x3C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |            |    |    |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------------|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18         | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MODE2[2:0] |    |    |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw         | rw | rw |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2          | 1  | 0  |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MODE1[2:0] |    |    |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw         | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 Reserved, must be kept at reset value.

Bit 24 Reserved, must be kept at reset value.

Bits 23:19 Reserved, must be kept at reset value.

Bits 18:16 **MODE2[2:0]**: DAC channel2 mode

These bits can be written only when the DAC is disabled and not in the calibration mode (when bit EN2 = 0 and bit CEN2 = 0 in the DAC\_CR register). If EN2 = 1 or CEN2 = 1 the write operation is ignored.

They can be set and cleared by software to select the DAC channel2 mode:

- DAC channel2 in Normal mode
  - 000: DAC channel2 is connected to external pin with Buffer enabled
  - 001: DAC channel2 is connected to external pin and to on chip peripherals with buffer enabled
  - 010: DAC channel2 is connected to external pin with buffer disabled
  - 011: DAC channel2 is connected to on chip peripherals with Buffer disabled
- DAC channel2 in Sample and hold mode
  - 100: DAC channel2 is connected to external pin with Buffer enabled
  - 101: DAC channel2 is connected to external pin and to on chip peripherals with Buffer enabled
  - 110: DAC channel2 is connected to external pin and to on chip peripherals with Buffer disabled
  - 111: DAC channel2 is connected to on chip peripherals with Buffer disabled

*Note: This register can be modified only when EN2 = 0.*

*Refer to [Section 19.3: DAC implementation](#) for the availability of DAC channel2.*

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 Reserved, must be kept at reset value.

Bit 8 Reserved, must be kept at reset value.

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **MODE1[2:0]**: DAC channel1 mode

These bits can be written only when the DAC is disabled and not in the calibration mode (when bit EN1 = 0 and bit CEN1 = 0 in the DAC\_CR register). If EN1 = 1 or CEN1 = 1 the write operation is ignored.

They can be set and cleared by software to select the DAC channel1 mode:

- DAC channel1 in Normal mode
  - 000: DAC channel1 is connected to external pin with Buffer enabled
  - 001: DAC channel1 is connected to external pin and to on chip peripherals with Buffer enabled
  - 010: DAC channel1 is connected to external pin with Buffer disabled
  - 011: DAC channel1 is connected to on chip peripherals with Buffer disabled
- DAC channel1 in sample & hold mode
  - 100: DAC channel1 is connected to external pin with Buffer enabled
  - 101: DAC channel1 is connected to external pin and to on chip peripherals with Buffer enabled
  - 110: DAC channel1 is connected to external pin and to on chip peripherals with Buffer disabled
  - 111: DAC channel1 is connected to on chip peripherals with Buffer disabled

*Note: This register can be modified only when EN1 = 0.*

### 19.7.17 DAC channel1 sample and hold sample time register (DAC\_SHSR1)

Address offset: 0x40

Reset value: 0x0000 0000

|      |      |      |      |      |      |               |      |      |      |      |      |      |      |      |      |

|      |      |      |      |      |      | r/w           | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  |

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TSAMPLE1[9:0]**: DAC channel1 sample time (only valid in Sample and hold mode)

These bits can be written when the DAC channel1 is disabled or also during normal operation. in the latter case, the write can be done only when BWST1 of DAC\_SR register is low, If BWST1 = 1, the write operation is ignored.

**Note:** *It represents the number of LSI clocks to perform a sample phase. Sampling time = (TSAMPLE1[9:0] + 1) x LSI clock period.*

### 19.7.18 DAC channel2 sample and hold sample time register (DAC\_SHSR2)

This register is available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).

Address offset: 0x44

Reset value: 0x0000 0000

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **THOLD2[9:0]**: DAC channel2 hold time (only valid in Sample and hold mode).

Hold time = (THOLD[9:0]) x LSI clock period

*Note: This register can be modified only when EN2 = 0.*

*These bits are available only on dual-channel DACs. Refer to [Section 19.3: DAC implementation](#).*

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **THOLD1[9:0]**: DAC channel1 hold time (only valid in Sample and hold mode)

Hold time = (THOLD[9:0]) x LSI clock period

*Note: This register can be modified only when EN1 = 0.*

*Note: These bits can be written only when the DAC channel is disabled and in Normal operating mode (when bit ENx = 0 and bit CENx = 0 in the DAC\_CR register). If ENx = 1 or CENx = 1 the write operation is ignored.*

### 19.7.20 DAC sample and hold refresh time register (DAC\_SHRR)

Address offset: 0x4C

Reset value: 0x0001 0001

|      |      |      |      |      |      |      |      |                |    |    |    |    |    |    |    |
|------|------|------|------|------|------|------|------|----------------|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23             | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 20 Digital camera interface (DCMI)

This section applies to STM32L49x/L4Ax devices only.

### 20.1 Introduction

The digital camera is a synchronous parallel interface able to receive a high-speed data flow from an external 8-, 10-, 12- or 14-bit CMOS camera module. It supports different data formats: YCbCr4:2:2/RGB565 progressive video and compressed data (JPEG).

### 20.2 DCMI main features

- 8-, 10-, 12- or 14-bit parallel interface
- Embedded/external line and frame synchronization
- Continuous or snapshot mode
- Crop feature
- Supports the following data formats:
  - 8/10/12/14-bit progressive video: either monochrome or raw Bayer
  - YCbCr 4:2:2 progressive video
  - RGB 565 progressive video
  - Compressed data: JPEG

### 20.3 DCMI functional description

The digital camera interface is a synchronous parallel interface that can receive high-speed data flows. It consists of up to 14 data lines (DCMI\_D[13:0]) and a pixel clock line (DCMI\_PIXCLK). The pixel clock has a programmable polarity, so that data can be captured on either the rising or the falling edge of the pixel clock.

The data are packed into a 32-bit data register (DCMI\_DR) and then transferred through a general-purpose DMA channel. The image buffer is managed by the DMA, not by the camera interface.

The data received from the camera can be organized in lines/frames (raw YUB/RGB/Bayer modes) or can be a sequence of JPEG images. To enable JPEG image reception, the JPEG bit (bit 3 of DCMI\_CR register) must be set.

The data flow is synchronized either by hardware using the optional DCMI\_HSYNC (horizontal synchronization) and DCMI\_VSYNC (vertical synchronization) signals or by synchronization codes embedded in the data flow.

### 20.3.1 DCMI block diagram

Figure 146 shows the DCMI block diagram.

Figure 146. DCMI block diagram

Figure 147. Top-level block diagram

### 20.3.2 DCMI pins

The following table shows DCMI pins.

Table 131. DCMI input/output pins

| Mode                                    | Pin name                                                   | Signal type | Description                             |
|-----------------------------------------|------------------------------------------------------------|-------------|-----------------------------------------|
| 8 bits<br>10 bits<br>12 bits<br>14 bits | DCMI_D[7:0]<br>DCMI_D[9:0]<br>DCMI_D[11:0]<br>DCMI_D[13:0] | Inputs      | DCMI data                               |
|                                         | DCMI_PIXCLK                                                | Input       | Pixel clock                             |
|                                         | DCMI_HSYNC                                                 | Input       | Horizontal synchronization / Data valid |
|                                         | DCMI_VSYNC                                                 | Input       | Vertical synchronization                |

### 20.3.3 DCMI clocks

The digital camera interface uses two clock domains, DCMI\_PIXCLK and HCLK. The signals generated with DCMI\_PIXCLK are sampled on the rising edge of HCLK once they are stable. An enable signal is generated in the HCLK domain, to indicate that data coming

from the camera are stable and can be sampled. The maximum DCMI\_PIXCLK period must be higher than 2.5 HCLK periods.

### 20.3.4 DCMI DMA interface

The DMA interface is active when the CAPTURE bit of the DCMI\_CR register is set. A DMA request is generated each time the camera interface receives a complete 32-bit data block in its register.

### 20.3.5 DCMI physical interface

The interface is composed of 11/13/15/17 inputs. Only the Slave mode is supported.

The camera interface can capture 8-bit, 10-bit, 12-bit or 14-bit data depending on the EDM[1:0] bits of the DCMI\_CR register. If less than 14 bits are used, the unused input pins must be connected to ground.

DCMI pins are shown in [Table 131](#).

The data are synchronous with DCMI\_PIXCLK and change on the rising/falling edge of the pixel clock depending on the polarity.

The DCMI\_HSYNC signal indicates the start/end of a line.

The DCMI\_VSYNC signal indicates the start/end of a frame

**Figure 148. DCMI signal waveforms**

1. The capture edge of DCMI\_PIXCLK is the falling edge, the active state of DCMI\_HSYNC and DCMI\_VSYNC is 1.
2. DCMI\_HSYNC and DCMI\_VSYNC can change states at the same time.

#### 8-bit data

When EDM[1:0] = 00 in DCMI\_CR the interface captures 8 LSBs at its input (DCMI\_D[7:0]) and stores them as 8-bit data. The DCMI\_D[13:8] inputs are ignored. In this case, to capture a 32-bit word, the camera interface takes four pixel clock cycles.

The first captured data byte is placed in the LSB position in the 32-bit word and the 4<sup>th</sup> captured data byte is placed in the MSB position in the 32-bit word. The table below gives an example of the positioning of captured data bytes in two 32-bit words.

**Table 132. Positioning of captured data bytes in 32-bit words (8-bit width)**

| Byte address | 31:24          | 23:16          | 15:8           | 7:0            |
|--------------|----------------|----------------|----------------|----------------|
| 0            | $D_{n+3}[7:0]$ | $D_{n+2}[7:0]$ | $D_{n+1}[7:0]$ | $D_n[7:0]$     |
| 4            | $D_{n+7}[7:0]$ | $D_{n+6}[7:0]$ | $D_{n+5}[7:0]$ | $D_{n+4}[7:0]$ |

**10-bit data**

When  $EDM[1:0] = 01$  in DCMI\_CR, the camera interface captures 10-bit data at its input DCMI\_D[9:0] and stores them as the 10 least significant bits of a 16-bit word. The remaining most significant bits of the DCMI\_DR register (bits 11 to 15) are cleared to zero. So, in this case, a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2<sup>nd</sup> captured data are placed in the MSB position in the 32-bit word as shown in the table below.

**Table 133. Positioning of captured data bytes in 32-bit words (10-bit width)**

| Byte address | 31:26 | 25:16          | 15:10 | 9:0            |
|--------------|-------|----------------|-------|----------------|
| 0            | 0     | $D_{n+1}[9:0]$ | 0     | $D_n[9:0]$     |
| 4            | 0     | $D_{n+3}[9:0]$ | 0     | $D_{n+2}[9:0]$ |

**12-bit data**

When  $EDM[1:0] = 10$  in DCMI\_CR, the camera interface captures the 12-bit data at its input DCMI\_D[11:0] and stores them as the 12 least significant bits of a 16-bit word. The remaining most significant bits are cleared to zero. So, in this case a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2<sup>nd</sup> captured data are placed in the MSB position in the 32-bit word as shown in the table below.

**Table 134. Positioning of captured data bytes in 32-bit words (12-bit width)**

| Byte address | 31:28 | 27:16           | 15:12 | 11:0            |
|--------------|-------|-----------------|-------|-----------------|
| 0            | 0     | $D_{n+1}[11:0]$ | 0     | $D_n[11:0]$     |
| 4            | 0     | $D_{n+3}[11:0]$ | 0     | $D_{n+2}[11:0]$ |

**14-bit data**

When  $EDM[1:0] = 11$  in DCMI\_CR, the camera interface captures the 14-bit data at its input DCMI\_D[13:0] and stores them as the 14 least significant bits of a 16-bit word. The remaining most significant bits are cleared to zero. So, in this case a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2<sup>nd</sup> captured data are placed in the MSB position in the 32-bit word as shown in the table below.

Table 135. Positioning of captured data bytes in 32-bit words (14-bit width)

| Byte address | 31:30 | 29:16           | 15:14 | 13:0            |
|--------------|-------|-----------------|-------|-----------------|
| 0            | 0     | $D_{n+1}[13:0]$ | 0     | $D_n[13:0]$     |
| 4            | 0     | $D_{n+3}[13:0]$ | 0     | $D_{n+2}[13:0]$ |

### 20.3.6 DCMI synchronization

The digital camera interface supports embedded or hardware (DCMI\_HSYNC and DCMI\_VSYNC) synchronization. When embedded synchronization is used, it is up to the digital camera module to make sure that the 0x00 and 0xFF values are used ONLY for synchronization (not in data). Embedded synchronization codes are supported only for the 8-bit parallel data interface width (that is, in the DCMI\_CR register, the EDM[1:0] bits must be cleared).

For compressed data, the DCMI supports only the hardware synchronization mode. In this case, DCMI\_VSYNC is used as a start/end of the image, and DCMI\_HSYNC is used as a Data Valid signal. [Figure 149](#) shows the corresponding timing diagram.

Figure 149. Timing diagram

#### Hardware synchronization mode

In hardware synchronization mode, the two synchronization signals (DCMI\_HSYNC/DCMI\_VSYNC) are used.

Depending on the camera module/mode, data may be transmitted during horizontal/vertical synchronization periods. The DCMI\_HSYNC/DCMI\_VSYNC signals act like blanking signals since all the data received during DCMI\_HSYNC/DCMI\_VSYNC active periods are ignored.

In order to correctly transfer images into the DMA/RAM buffer, data transfer is synchronized with the DCMI\_VSYNC signal. When the hardware synchronization mode is selected, and

capture is enabled (CAPTURE bit set in DCMI\_CR), data transfer is synchronized with the deactivation of the DCMI\_VSYNC signal (next start of frame).

Transfer can then be continuous, with successive frames transferred by DMA to successive buffers or the same/circular buffer. To allow the DMA management of successive frames, a VSIF (Vertical synchronization interrupt flag) is activated at the end of each frame.

### Embedded data synchronization mode

In this synchronization mode, the data flow is synchronized using 32-bit codes embedded in the data flow. These codes use the 0x00/0xFF values that are *not* used in data anymore. There are 4 types of codes, all with a 0xFF0000XY format. The embedded synchronization codes are supported only in 8-bit parallel data width capture (in the DCMI\_CR register, the EDM[1:0] bits must be cleared). For other data widths, this mode generates unpredictable results and must not be used.

*Note: Camera modules can have 8 such codes (in interleaved mode). For this reason, the interleaved mode is not supported by the camera interface (otherwise, every other half-frame would be discarded).*

- Mode 2

Four embedded codes signal the following events

- Frame start (FS)
- Frame end (FE)
- Line start (LS)
- Line end (LE)

The XY values in the 0xFF0000XY format of the four codes are programmable (see [Section 20.5.7: DCMI embedded synchronization code register \(DCMI\\_ESCR\)](#)).

A 0xFF value programmed as a “frame end” means that all the unused codes are interpreted as valid frame end codes.

In this mode, once the camera interface has been enabled, the frame capture starts after the first occurrence of the frame end (FE) code followed by a frame start (FS) code.

- Mode 1

An alternative coding is the camera mode 1. This mode is ITU656 compatible.

The codes signal another set of events:

- SAV (active line) - line start
- EAV (active line) - line end
- SAV (blanking) - end of line during interframe blanking period
- EAV (blanking) - end of line during interframe blanking period

This mode can be supported by programming the following codes:

- FS ≤ 0xFF
- FE ≤ 0xFF
- LS ≤ SAV (active)
- LE ≤ EAV (active)

An embedded unmask code is also implemented for frame/line start and frame/line end codes. Using it, it is possible to compare only the selected unmasked bits with the programmed code. A bit can therefore be selected to compare in the embedded code and

detect a frame/line start or frame/line end. This means that there can be different codes for the frame/line start and frame/line end with the unmasked bit position remaining the same.

### Example

FS = 0xA5

Unmask code for FS = 0x10

In this case the frame start code is embedded in the bit 4 of the frame start code.

## 20.3.7 DCMI capture modes

This interface supports two types of capture: snapshot (single frame) and continuous grab.

### Snapshot mode (single frame)

In this mode, a single frame is captured (CM = 1 of the DCMI\_CR register). After the CAPTURE bit is set in DCMI\_CR, the interface waits for the detection of a start of frame before sampling the data. The camera interface is automatically disabled (CAPTURE bit cleared in DCMI\_CR) after receiving the first complete frame. An interrupt is generated (IT\_FRAME) if it is enabled.

In case of an overrun, the frame is lost and the CAPTURE bit is cleared.

**Figure 150. Frame capture waveforms in snapshot mode**

1. Here, the active state of DCMI\_HSYNC and DCMI\_VSYNC is 1.
2. DCMI\_HSYNC and DCMI\_VSYNC can change states at the same time.

### Continuous grab mode

In this mode (CM bit = 0 in DCMI\_CR), once the CAPTURE bit has been set in DCMI\_CR, the grabbing process starts on the next DCMI\_VSYNC or embedded frame start depending on the mode. The process continues until the CAPTURE bit is cleared in DCMI\_CR. Once the CAPTURE bit has been cleared, the grabbing process continues until the end of the current frame.

Figure 151. Frame capture waveforms in continuous grab mode

1. Here, the active state of DCMI\_HSYNC and DCMI\_VSYNC is 1.
2. DCMI\_HSYNC and DCMI\_VSYNC can change states at the same time.

In continuous grab mode, the FCRC[1:0] bits in DCMI\_CR can be configured to grab all pictures, every second picture or one out of four pictures to decrease the frame capture rate.

**Note:** *In the hardware synchronization mode (ESS = 0 in DCMI\_CR), the IT\_VSYNC interrupt is generated (if enabled) even when CAPTURE = 0 in DCMI\_CR so, to reduce the frame capture rate even further, the IT\_VSYNC interrupt can be used to count the number of frames between 2 captures in conjunction with the Snapshot mode. This is not allowed by embedded data synchronization mode.*

### 20.3.8 DCMI crop feature

With the crop feature, the camera interface can select a rectangular window from the received image. The start (upper left corner) coordinates and size (horizontal dimension in number of pixel clocks and vertical dimension in number of lines) are specified using two 32-bit registers (DCMI\_CWSTRT and DCMI\_CWSIZE). The size of the window is specified in number of pixel clocks (horizontal dimension) and in number of lines (vertical dimension).

Figure 152. Coordinates and size of the window after cropping

These registers specify the coordinates of the starting point of the capture window as a line number (in the frame, starting from 0) and a number of pixel clocks (on the line, starting from 0), and the size of the window as a line number and a number of pixel clocks. The CAPCNT value can only be a multiple of 4 (two least significant bits are forced to 0) to allow the correct transfer of data through the DMA.

If the DCMI\_VSYNC signal goes active before the number of lines is specified in the DCMI\_CWSIZE register, then the capture stops and an IT\_FRAME interrupt is generated when enabled.

**Figure 153. Data capture waveforms**

1. Here, the active state of DCMI\_HSYNC and DCMI\_VSYNC is 1.
2. DCMI\_HSYNC and DCMI\_VSYNC can change states at the same time.

### 20.3.9 DCMI JPEG format

To allow JPEG image reception, it is necessary to set the JPEG bit of the DCMI\_CR register. JPEG images are not stored as lines and frames, so the DCMI\_VSYNC signal is used to start the capture while DCMI\_HSYNC serves as a data enable signal. The number of bytes in a line may not be a multiple of 4. This case must be carefully handled since a DMA request is generated each time a complete 32-bit word has been constructed from the captured data. When an end of frame is detected and the 32-bit word to be transferred has not been completely received, the remaining data are padded with zeros and a DMA request is generated.

The crop feature and embedded synchronization codes cannot be used in JPEG format.

### 20.3.10 DCMI FIFO

A 8-word FIFO is implemented to manage data rate transfers on the AHB. The DCMI features a simple FIFO controller with a read pointer incremented each time the camera interface reads from the AHB, and a write pointer incremented each time the camera interface writes to the FIFO. There is no overrun protection to prevent the data from being overwritten if the AHB interface does not sustain the data transfer rate.

In case of overrun or errors in the synchronization signals, the FIFO is reset and the DCMI interface waits for a new start of frame.

## 20.3.11 DCMI data format description

### Data formats

The following types of data are supported:

- 8/10/12/14-bit progressive video: either monochrome or raw Bayer format
- YCbCr 4:2:2 progressive video
- RGB565 progressive video. A pixel coded in 16 bits (5 bits for blue, 5 bits for red, 6 bits for green) takes two clock cycles to be transferred
- compressed data: JPEG

For monochrome, RGB and YCbCr, the frame buffer is stored in raster mode. 32-bit words are used. Only the little-endian format is supported.

**Figure 154. Pixel raster scan order**

### Monochrome format

Characteristics:

- Raster format
- 8 bits per pixel

The table below shows how the data are stored.

**Table 136. Data storage in monochrome progressive video format**

| Byte address | 31:24 | 23:16 | 15:8  | 7:0   |
|--------------|-------|-------|-------|-------|
| 0            | n + 3 | n + 2 | n + 1 | n     |
| 4            | n + 7 | n + 6 | n + 5 | n + 4 |

### RGB format

Characteristics:

- Raster format
- RGB
- Interleaved: one buffer: R, G and B interleaved (such as BRGBRBRG)
- Optimized for display output

The RGB planar format is compatible with standard OS frame buffer display formats.

Only 16 BPP (bits per pixel): RGB565 (2 pixels per 32-bit word) is supported.

The 24 BPP (palletized format) and gray-scale formats are not supported. Pixels are stored in a raster scan order, that is from top to bottom for pixel rows, and from left to right within a pixel row. Pixel components are R (red), G (green) and B (blue). All components have the same spatial resolution (4:4:4 format). A frame is stored in a single part, with the components interleaved on a pixel basis.

The table below shows how the data are stored.

**Table 137. Data storage in RGB progressive video format**

| Byte address | 31:27     | 26:21       | 20:16      | 15:11     | 10:5        | 4:0        |
|--------------|-----------|-------------|------------|-----------|-------------|------------|
| 0            | Red n + 1 | Green n + 1 | Blue n + 1 | Red n     | Green n     | Blue n     |
| 4            | Red n + 4 | Green n + 3 | Blue n + 3 | Red n + 2 | Green n + 2 | Blue n + 2 |

### YCbCr format

Characteristics:

- Raster format
- YCbCr 4:2:2
- Interleaved: one buffer: Y, Cb and Cr interleaved (such as CbYCrYCbYCr)

Pixel components are Y (luminance or “luma”), Cb and Cr (chrominance or “chroma” blue and red). Each component is encoded in 8 bits. Luma and chroma are stored together (interleaved) as shown in the table below.

**Table 138. Data storage in YCbCr progressive video format**

| Byte address | 31:24   | 23:16    | 15:8    | 7:0      |
|--------------|---------|----------|---------|----------|
| 0            | Y n + 1 | Cr n     | Y n     | Cb n     |
| 4            | Y n + 3 | Cr n + 2 | Y n + 2 | Cb n + 2 |

### YCbCr format - Y only

Characteristics:

- Raster format
- YCbCr 4:2:2
- The buffer only contains Y information - monochrome image

Pixel components are Y (luminance or “luma”), Cb and Cr (chrominance or “chroma” blue and red). In this mode, the chroma information is dropped. Only the luma component of each pixel, encoded in 8 bits, is stored as shown in [Table 139](#).

The result is a monochrome image having the same resolution as the original YCbCr data.

**Table 139. Data storage in YCbCr progressive video format - Y extraction mode**

| Byte address | 31:24   | 23:16   | 15:8    | 7:0     |
|--------------|---------|---------|---------|---------|
| 0            | Y n + 3 | Y n + 2 | Y n + 1 | Y n     |
| 4            | Y n + 7 | Y n + 6 | Y n + 5 | Y n + 4 |

### Half resolution image extraction

This is a modification of the previous reception modes, being applicable to monochrome, RGB or Y extraction modes.

This mode is used to only store a half resolution image. It is selected through OELS and LSM control bits.

## 20.4 DCMI interrupts

Five interrupts are generated. All interrupts are maskable by software. The global interrupt (DCMI\_IT) is the OR of all the individual interrupts. The table below gives the list of all interrupts.

**Table 140. DCMI interrupts**

| Interrupt acronym | Interrupt event                                                       | Event flag | Enable control bit | Interrupt clear method | Exits Sleep mode | Exists Stop and Standby modes |
|-------------------|-----------------------------------------------------------------------|------------|--------------------|------------------------|------------------|-------------------------------|
| DCMI_IT           | End of line                                                           | LINE_RIS   | LINE_IE            | Set LINE_ISC           | Yes              | No                            |
|                   | End of frame capture                                                  | FRAME_RIS  | FRAME_IE           | Set FRAME_ISC          | Yes              | No                            |
|                   | Overrun of data reception                                             | OVR_RIS    | OVR_IE             | Set OVR_ISC            | Yes              | No                            |
|                   | Synchronization frame                                                 | VSYSNC_RIS | VSYSNC_IE          | Set VSYSNC_ISC         | Yes              | No                            |
|                   | Detection of an error in the embedded synchronization frame detection | ERR_RIS    | ERR_IE             | Set ERR_ISC            | Yes              | No                            |

## 20.5 DCMI registers

Refer to [Section 1.2 on page 69](#) for list of abbreviations used in register descriptions. All DCMI registers must be accessed as 32-bit words, otherwise a bus error occurs.

### 20.5.1 DCMI control register (DCMI\_CR)

Address offset: 0x00

Reset value: 0x0000 0000

|      |            |      |      |          |      |           |      |       |       |            |      |      |      |          |             |

|      | rw         |      |      | rw       | rw   | rw        | rw   | rw    | rw    | rw         | rw   | rw   | rw   | rw       | rw          |

Bits 31:21 Reserved, must be kept at reset value.

- Bit 20 **OELS**: Odd/Even Line Select (Line Select Start)  
 This bit works in conjunction with the LSM field (LSM = 1).  
 0: Interface captures first line after the frame start, second one being dropped.  
 1: Interface captures second line from the frame start, first one being dropped.
- Bit 19 **LSM**: Line Select mode  
 0: Interface captures all received lines.  
 1: Interface captures one line out of two.
- Bit 18 **OEBS**: Odd/Even Byte Select (Byte Select Start)  
 This bit works in conjunction with BSM field (BSM  $\neq$  00).  
 0: Interface captures first data (byte or double byte) from the frame/line start, second one being dropped.  
 1: Interface captures second data (byte or double byte) from the frame/line start, first one being dropped.
- Bits 17:16 **BSM[1:0]**: Byte Select mode  
 00: Interface captures all received data.  
 01: Interface captures every other byte from the received data.  
 10: Interface captures one byte out of four.  
 11: Interface captures two bytes out of four.  
*Note: This mode only works for EDM[1:0] = 00. For all other EDM values, this field must be programmed to the reset value.*
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **ENABLE**: DCMI enable  
 0: DCMI disabled  
 1: DCMI enabled  
*Note: The DCMI configuration registers must be programmed correctly before enabling this bit.*
- Bits 13:12 Reserved, must be kept at reset value.
- Bits 11:10 **EDM[1:0]**: Extended data mode  
 00: Interface captures 8-bit data on every pixel clock.  
 01: Interface captures 10-bit data on every pixel clock.  
 10: Interface captures 12-bit data on every pixel clock.  
 11: Interface captures 14-bit data on every pixel clock.
- Bits 9:8 **FCRC[1:0]**: Frame capture rate control  
 These bits define the frequency of frame capture. They are meaningful only in Continuous grab mode. They are ignored in snapshot mode.  
 00: All frames are captured.  
 01: Every alternate frame captured (50% bandwidth reduction)  
 10: One frame out of four captured (75% bandwidth reduction)  
 11: reserved
- Bit 7 **VSPOL**: Vertical synchronization polarity  
 This bit indicates the level on the DCMI\_VSYNC pin when the data are not valid on the parallel interface.  
 0: DCMI\_VSYNC active low  
 1: DCMI\_VSYNC active high

**Bit 6 HSPOL:** Horizontal synchronization polarity

This bit indicates the level on the DCMI\_HSYNC pin when the data are not valid on the parallel interface.

- 0: DCMI\_HSYNC active low
- 1: DCMI\_HSYNC active high

**Bit 5 PCKPOL:** Pixel clock polarity

This bit configures the capture edge of the pixel clock.

- 0: Falling edge active
- 1: Rising edge active

**Bit 4 ESS:** Embedded synchronization select

- 0: Hardware synchronization data capture (frame/line start/stop) is synchronized with the DCMI\_HSYNC/DCMI\_VSYNC signals.
- 1: Embedded synchronization data capture is synchronized with synchronization codes embedded in the data flow.

*Note: Valid only for 8-bit parallel data. HSPOL/VSPOL are ignored when the ESS bit is set.*

This bit is disabled in JPEG mode.

**Bit 3 JPEG:** JPEG format

- 0: Uncompressed video format
- 1: This bit is used for JPEG data transfers. The DCMI\_HSYNC signal is used as data enable. The crop and embedded synchronization features (ESS bit) cannot be used in this mode.

**Bit 2 CROP:** Crop feature

- 0: The full image is captured. In this case the total number of bytes in an image frame must be a multiple of four.
- 1: Only the data inside the window specified by the crop register is captured. If the size of the crop window exceeds the picture size, then only the picture size is captured.

**Bit 1 CM:** Capture mode

- 0: Continuous grab mode - The received data are transferred into the destination memory through the DMA. The buffer location and mode (linear or circular buffer) is controlled through the system DMA.
- 1: Snapshot mode (single frame) - Once activated, the interface waits for the start of frame and then transfers a single frame through the DMA. At the end of the frame, the CAPTURE bit is automatically reset.

**Bit 0 CAPTURE:** Capture enable

- 0: Capture disabled
- 1: Capture enabled

The camera interface waits for the first start of frame, then a DMA request is generated to transfer the received data into the destination memory.

In snapshot mode, the CAPTURE bit is automatically cleared at the end of the first frame received.

In continuous grab mode, if the software clears this bit while a capture is ongoing, the bit is effectively cleared after the frame end.

*Note: The DMA controller and all DCMI configuration registers must be programmed correctly before enabling this bit.*

## 20.5.2 DCMI status register (DCMI\_SR)

Address offset: 0x04

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |       |       |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17    | 16    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res.  |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |       |       |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1     | 0     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FNE  | VSYNC | HSYNC |
|      |      |      |      |      |      |      |      |      |      |      |      |      | r    | r     | r     |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FNE**: FIFO not empty

This bit gives the status of the FIFO.

1: FIFO contains valid data.

0: FIFO empty

Bit 1 **VSYNC**: Vertical synchronization

This bit gives the state of the DCMI\_VSYNC pin with the correct programmed polarity. When embedded synchronization codes are used, the meaning of this bit is the following:

0: active frame

1: synchronization between frames

In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in DCMI\_CR is set.

Bit 0 **HSYNC**: Horizontal synchronization

This bit gives the state of the DCMI\_HSYNC pin with the correct programmed polarity. When embedded synchronization codes are used, the meaning of this bit is the following:

0: active line

1: synchronization between lines

In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in DCMI\_CR is set.

## 20.5.3 DCMI raw interrupt status register (DCMI\_RIS)

DCMI\_RIS gives the raw interrupt status and is accessible in read only. When read, this register returns the status of the corresponding interrupt before masking with the DCMI\_IER register value.

Address offset: 0x08

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |          |           |         |         |           |
|------|------|------|------|------|------|------|------|------|------|------|----------|-----------|---------|---------|-----------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20       | 19        | 18      | 17      | 16        |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.     | Res.      | Res.    | Res.    | Res.      |
|      |      |      |      |      |      |      |      |      |      |      |          |           |         |         |           |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4        | 3         | 2       | 1       | 0         |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LINE_RIS | VSYNC_RIS | ERR_RIS | OVR_RIS | FRAME_RIS |
|      |      |      |      |      |      |      |      |      |      |      | r        | r         | r       | r       | r         |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE\_RIS**: Line raw interrupt status

This bit gets set when the DCMI\_HSYNC signal changes from the inactive state to the active state. It goes high even if the line is not valid.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit in DCMI\_CR is set.

It is cleared by setting the LINE\_ISC bit of the DCMI\_ICR register.

Bit 3 **VSYNC\_RIS**: DCMI\_VSYNC raw interrupt status

This bit is set when the DCMI\_VSYNC signal changes from the inactive state to the active state.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit is set in DCMI\_CR.

It is cleared by setting the VSYNC\_ISC bit of the DCMI\_ICR register.

Bit 2 **ERR\_RIS**: Synchronization error raw interrupt status

0: No synchronization error detected

1: Embedded synchronization characters are not received in the correct order.

This bit is valid only in the embedded synchronization mode. It is cleared by setting the ERR\_ISC bit of the DCMI\_ICR register.

*Note: This bit is available only in embedded synchronization mode.*

Bit 1 **OVR\_RIS**: Overrun raw interrupt status

0: No data buffer overrun occurred

1: A data buffer overrun occurred and the data FIFO is corrupted.

The bit is cleared by setting the OVR\_ISC bit of the DCMI\_ICR register.

Bit 0 **FRAME\_RIS**: Capture complete raw interrupt status

0: No new capture

1: A frame has been captured.

This bit is set when a frame or window has been captured.

In case of a cropped window, this bit is set at the end of line of the last line in the crop. It is set even if the captured frame is empty (for example window cropped outside the frame).

The bit is cleared by setting the FRAME\_ISC bit of the DCMI\_ICR register.

## 20.5.4 DCMI interrupt enable register (DCMI\_IER)

The DCMI\_IER register is used to enable interrupts. When one of the DCMI\_IER bits is set, the corresponding interrupt is enabled. This register is accessible in both read and write.

Address offset: 0x0C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |             |             |            |            |              |
|------|------|------|------|------|------|------|------|------|------|------|-------------|-------------|------------|------------|--------------|

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.        | Res.        | Res.       | Res.       | Res.         |
|      |      |      |      |      |      |      |      |      |      |      |             |             |            |            |              |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4           | 3           | 2          | 1          | 0            |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LINE<br>_IE | VSYN<br>_IE | ERR<br>_IE | OVR<br>_IE | FRAME<br>_IE |
|      |      |      |      |      |      |      |      |      |      |      | rw          | rw          | rw         | rw         | rw           |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE\_IE**: Line interrupt enable

0: No interrupt generation when the line is received

1: An Interrupt is generated when a line has been completely received.

Bit 3 **VSYNC\_IE**: DCMI\_VSYNC interrupt enable

0: No interrupt generation

1: An interrupt is generated on each DCMI\_VSYNC transition from the inactive to the active state.

The active state of the DCMI\_VSYNC signal is defined by the VSPOL bit.

Bit 2 **ERR\_IE**: Synchronization error interrupt enable

0: No interrupt generation

1: An interrupt is generated if the embedded synchronization codes are not received in the correct order.

*Note: This bit is available only in embedded synchronization mode.*

Bit 1 **OVR\_IE**: Overrun interrupt enable

0: No interrupt generation

1: An interrupt is generated if the DMA was not able to transfer the last data before new data (32-bit) are received.

Bit 0 **FRAME\_IE**: Capture complete interrupt enable

0: No interrupt generation

1: An interrupt is generated at the end of each received frame/crop window (in crop mode).

### 20.5.5 DCMI masked interrupt status register (DCMI\_MIS)

This DCMI\_MIS register is a read-only register. When read, it returns the current masked status value (depending on the value in DCMI\_IER) of the corresponding interrupt. A bit in this register is set if the corresponding enable bit in DCMI\_IER is set and the corresponding bit in DCMI\_RIS is set.

Address offset: 0x10

Reset value: 0x0000 0000

| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20       | 19        | 18      | 17      | 16        |
|------|------|------|------|------|------|------|------|------|------|------|----------|-----------|---------|---------|-----------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.     | Res.      | Res.    | Res.    | Res.      |
|      |      |      |      |      |      |      |      |      |      |      |          |           |         |         |           |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4        | 3         | 2       | 1       | 0         |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LINE_MIS | VSYSN_MIS | ERR_MIS | OVR_MIS | FRAME_MIS |
|      |      |      |      |      |      |      |      |      |      |      | r        | r         | r       | r       | r         |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE\_MIS**: Line masked interrupt status

This bit gives the status of the masked line interrupt.

0: No interrupt generation when the line is received

1: An interrupt is generated when a line has been completely received and the LINE\_IE bit is set in DCMI\_IER.

Bit 3 **VSYNC\_MIS**: VSYNC masked interrupt status

This bit gives the status of the masked VSYNC interrupt.

0: No interrupt is generated on DCMI\_VSYNC transitions.

1: An interrupt is generated on each DCMI\_VSYNC transition from the inactive to the active state and the VSYNC\_IE bit is set in DCMI\_IER.

The active state of the DCMI\_VSYNC signal is defined by the VSPOL bit.

Bit 2 **ERR\_MIS**: Synchronization error masked interrupt status

This bit gives the status of the masked synchronization error interrupt.

0: No interrupt is generated on a synchronization error.

1: An interrupt is generated if the embedded synchronization codes are not received in the correct order and the ERR\_IE bit in DCMI\_IER is set.

*Note: This bit is available only in embedded synchronization mode.*

Bit 1 **OVR\_MIS**: Overrun masked interrupt status

This bit gives the status of the masked overflow interrupt.

0: No interrupt is generated on overrun.

1: An interrupt is generated if the DMA was not able to transfer the last data before new data (32-bit) are received and the OVR\_IE bit is set in DCMI\_IER.

Bit 0 **FRAME\_MIS**: Capture complete masked interrupt status

This bit gives the status of the masked capture complete interrupt

0: No interrupt is generated after a complete capture.

1: An interrupt is generated at the end of each received frame/crop window (in crop mode) and the FRAME\_IE bit is set in DCMI\_IER.

## 20.5.6 DCMI interrupt clear register (DCMI\_ICR)

The DCMI\_ICR register is write-only. Setting a bit of this register clears the corresponding flag in the DCMI\_RIS and DCMI\_MIS registers. Writing 0 has no effect.

Address offset: 0x14

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |              |                |             |             |               |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LINE<br>_ISC | VSYSN<br>C_ISC | ERR<br>_ISC | OVR<br>_ISC | FRAME<br>_ISC |
|      |      |      |      |      |      |      |      |      |      |      | w            | w              | w           | w           | w             |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE\_ISC**: line interrupt status clear

Setting this bit clears the LINE\_RIS flag in the DCMI\_RIS register.

Bit 3 **VSYSNC\_ISC**: Vertical Synchronization interrupt status clear

Setting this bit clears the VSYSNC\_RIS flag in the DCMI\_RIS register.

Bit 2 **ERR\_ISC**: Synchronization error interrupt status clear

Setting this bit clears the ERR\_RIS flag in the DCMI\_RIS register.

*Note: This bit is available only in embedded synchronization mode.*

Bit 1 **OVR\_ISC**: Overrun interrupt status clear

Setting this bit clears the OVR\_RIS flag in the DCMI\_RIS register.

Bit 0 **FRAME\_ISC**: Capture complete interrupt status clear

Setting this bit clears the FRAME\_RIS flag in the DCMI\_RIS register.

## 20.5.7 DCMI embedded synchronization code register (DCMI\_ESCR)

Address offset: 0x18

Reset value: 0x0000 0000

|          |    |    |    |    |    |    |    |          |    |    |    |    |    |    |    |
|----------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23       | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| FEC[7:0] |    |    |    |    |    |    |    | LEC[7:0] |    |    |    |    |    |    |    |
| rw       | rw | rw | rw | rw | rw | rw | rw | rw       | rw | rw | rw | rw | rw | rw | rw |
| 15       | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7        | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| LSC[7:0] |    |    |    |    |    |    |    | FSC[7:0] |    |    |    |    |    |    |    |
| rw       | rw | rw | rw | rw | rw | rw | rw | rw       | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **FEC[7:0]**: Frame end delimiter code

This byte specifies the code of the frame end delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, FEC.

If FEC is programmed to 0xFF, all the unused codes (0xFF0000XY) are interpreted as frame end delimiters.

Bits 23:16 **LEC[7:0]**: Line end delimiter code

This byte specifies the code of the line end delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, LEC.

Bits 15:8 **LSC[7:0]**: Line start delimiter code

This byte specifies the code of the line start delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, LSC.

Bits 7:0 **FSC[7:0]**: Frame start delimiter code

This byte specifies the code of the frame start delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, FSC.

If FSC is programmed to 0xFF, no frame start delimiter is detected. But, the first occurrence of LSC after an FEC code is interpreted as a start of frame delimiter.

## 20.5.8 DCMI embedded synchronization unmask register (DCMI\_ESUR)

Address offset: 0x1C

Reset value: 0x0000 0000

|          |    |    |    |    |    |    |    |          |    |    |    |    |    |    |    |
|----------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|

| rw       | rw | rw | rw | rw | rw | rw | rw | rw       | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **FEU[7:0]**: Frame end delimiter unmask

This byte specifies the mask to be applied to the code of the frame end delimiter.

0: The corresponding bit in the FEC byte in DCMI\_ESCR is masked while comparing the frame end delimiter with the received data.

1: The corresponding bit in the FEC byte in DCMI\_ESCR is compared while comparing the frame end delimiter with the received data.

Bits 23:16 **LEU[7:0]**: Line end delimiter unmask

This byte specifies the mask to be applied to the code of the line end delimiter.

0: The corresponding bit in the LEC byte in DCMI\_ESCR is masked while comparing the line end delimiter with the received data.

1: The corresponding bit in the LEC byte in DCMI\_ESCR is compared while comparing the line end delimiter with the received data.

Bits 15:8 **LSU[7:0]**: Line start delimiter unmask

This byte specifies the mask to be applied to the code of the line start delimiter.

0: The corresponding bit in the LSC byte in DCMI\_ESCR is masked while comparing the line start delimiter with the received data.

1: The corresponding bit in the LSC byte in DCMI\_ESCR is compared while comparing the line start delimiter with the received data.

Bits 7:0 **FSU[7:0]**: Frame start delimiter unmask

This byte specifies the mask to be applied to the code of the frame start delimiter.

0: The corresponding bit in the FSC byte in DCMI\_ESCR is masked while comparing the frame start delimiter with the received data.

1: The corresponding bit in the FSC byte in DCMI\_ESCR is compared while comparing the frame start delimiter with the received data.

## 20.5.9 DCMI crop window start (DCMI\_CWSTRT)

Address offset: 0x20

Reset value: 0x0000 0000

|      |      |               |           |    |    |    |    |    |    |    |    |    |    |    |    |
|------|------|---------------|-----------|----|----|----|----|----|----|----|----|----|----|----|----|
| 31   | 30   | 29            | 28        | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | HOFFCNT[13:0] |           |    |    |    |    |    |    |    |    |    |    |    |    |
|      |      | rw            | rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:16 **VST[12:0]**: Vertical start line count

The image capture starts with this line number. Previous line data are ignored.

0x0000: line 1

0x0001: line 2

0x0002: line 3

....

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **HOFFCNT[13:0]**: Horizontal offset count

This value gives the number of pixel clocks to count before starting a capture.

### 20.5.10 DCMI crop window size (DCMI\_CWSIZE)

Address offset: 0x24

Reset value: 0x0000 0000

|      |      |              |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------|------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|

|      |      | rw           | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **VLINE[13:0]**: Vertical line count

This value gives the number of lines to be captured from the starting point.

0x0000: 1 line

0x0001: 2 lines

0x0002: 3 lines

....

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **CAPCNT[13:0]**: Capture count

This value gives the number of pixel clocks to be captured from the starting point on the same line. It value must corresponds to word-aligned data for different widths of parallel interfaces.

0x0000: 1 pixel

0x0001: 2 pixels

0x0002: 3 pixels

....

### 20.5.11 DCMI data register (DCMI\_DR)

Address offset: 0x28

Reset value: 0x0000 0000

The digital camera Interface packages all the received data in 32-bit format before requesting a DMA transfer. A 8-word deep FIFO is available to leave enough time for DMA transfers and avoid DMA overrun conditions.

Refer to [Section 2.2](#) for the register boundary addresses.

## 21 Voltage reference buffer (VREFBUF)

### 21.1 Introduction

The devices embed a voltage reference buffer which can be used as voltage reference for ADCs, DACs and also as voltage reference for external components through the VREF+ pin. When the VREF+ pin is double-bonded with VDDA pin in a package, the voltage reference buffer is not available and must be kept disabled (refer to datasheet for packages pinout description).

### 21.2 VREFBUF functional description

The internal voltage reference buffer supports two voltages<sup>(a)</sup>, which are configured with VRS bits in the VREFBUF\_CSR register:

- VRS = 0: V<sub>REF\_OUT1</sub> around 2.048 V.
- VRS = 1: V<sub>REF\_OUT2</sub> around 2.5 V.

The internal voltage reference can be configured in four different modes depending on ENVR and HIZ bits configuration. These modes are provided in the table below:

**Table 142. VREF buffer modes**

| ENVR | HIZ | VREF buffer configuration                                                                                                                                            |
|------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | 0   | VREFBUF buffer off mode:<br>– V <sub>REF+</sub> pin pulled-down to V <sub>SSA</sub>                                                                                  |
| 0    | 1   | External voltage reference mode (default value):<br>– VREFBUF buffer off<br>– V <sub>REF+</sub> pin input mode                                                       |
| 1    | 0   | Internal voltage reference mode:<br>– VREFBUF buffer on<br>– V <sub>REF+</sub> pin connected to VREFBUF buffer output                                                |
| 1    | 1   | Hold mode:<br>– VREF is enable without output buffer, VREF+ pin voltage is hold with the external capacitor<br>– VRR detection disabled and VRR bit keeps last state |

After enabling the VREFBUF by setting ENVR bit and clearing HIZ bit in the VREFBUF\_CSR register, the user must wait until VRR bit is set, meaning that the voltage reference output has reached its expected value.

a. The minimum V<sub>DDA</sub> voltage depends on VRS setting, refer to the product datasheet.

## 21.3 VREFBUF trimming

For VRS = 1 setting, the VREFBUF output voltage is factory-calibrated by ST. The calibration data is automatically loaded to the TRIM register at reset.

For VRS = 0 setting, the calibration data is not available. The user can trim the output voltage by changing the TRIM register bits.

## 21.4 VREFBUF registers

### 21.4.1 VREFBUF control and status register (VREFBUF\_CSR)

Address offset: 0x00

Reset value: 0x0000 0002

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VRR  | VRS  | HIZ  | ENVR |
|      |      |      |      |      |      |      |      |      |      |      |      | r    | rw   | rw   | rw   |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **VRR**: Voltage reference buffer ready

0: the voltage reference buffer output is not ready.

1: the voltage reference buffer output reached the requested level.

Bit 2 **VRS**: Voltage reference scale

This bit selects the value generated by the voltage reference buffer.

0: Voltage reference set to  $V_{REF\_OUT1}$  (around 2.048 V).

1: Voltage reference set to  $V_{REF\_OUT2}$  (around 2.5 V).

Bit 1 **HIZ**: High impedance mode

This bit controls the analog switch to connect or not the  $V_{REF+}$  pin.

0:  $V_{REF+}$  pin is internally connected to the voltage reference buffer output.

1:  $V_{REF+}$  pin is high impedance.

Refer to [Table 142: VREF buffer modes](#) for the mode descriptions depending on ENVR bit configuration.

Bit 0 **ENVR**: Voltage reference buffer mode enable

This bit is used to enable the voltage reference buffer mode.

0: Internal voltage reference mode disable (external voltage reference mode).

1: Internal voltage reference mode (reference buffer enable or hold mode) enable.

## 21.4.2 VREFBUF calibration control register (VREFBUF\_CCR)

Address offset: 0x04

Reset value: 0x0000 00XX

|      |      |      |      |      |      |      |      |      |      |           |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|-----------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21        | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |           |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5         | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRIM[5:0] |      |      |      |      |      |
|      |      |      |      |      |      |      |      |      |      | rw        | rw   | rw   | rw   | rw   | rw   |

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **TRIM[5:0]**: Trimming code

For VRS = 1 (2.5 V), these bits are automatically initialized after reset with the trimming value stored in the flash memory during the production test. Writing into these bits allows the tuning of the internal reference buffer voltage.

*Note: If the user application performs the trimming, the trimming code should start from 000000 to 111111 in ascending order.*

## 21.4.3 VREFBUF register map

The following table gives the VREFBUF register map and the reset values.

**Table 143. VREFBUF register map and reset values**

| Offset | Register name | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5         | 4    | 3   | 2   | 1   | 0    |  |

|        | Reset value   |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | x         | x    | x   | x   | x   | x    |  |

Refer to [Section 2.2](#) for the register boundary addresses.

## 22 Comparator (COMP)

### 22.1 Introduction

The device embeds two ultra-low-power comparators COMP1, and COMP2

The comparators can be used for a variety of functions including:

- Wake-up from low-power mode triggered by an analog signal,
- Analog signal conditioning,
- Cycle-by-cycle current control loop when combined with a PWM output from a timer.

### 22.2 COMP main features

- Each comparator has configurable plus and minus inputs used for flexible voltage selection:
  - Multiplexed I/O pins
  - DAC Channel1 and Channel2
  - Internal reference voltage and three submultiple values (1/4, 1/2, 3/4) provided by scaler (buffered voltage divider)
- Programmable hysteresis
- Programmable speed / consumption
- The outputs can be redirected to an I/O or to timer inputs for triggering:
  - Break events for fast PWM shutdowns
- Comparator outputs with blanking source
- The two comparators can be combined in a window comparator
- Each comparator has interrupt generation capability with wake-up from Sleep and Stop modes (through the EXTI controller)

## 22.3 COMP functional description

### 22.3.1 COMP block diagram

The block diagram of the comparators is shown in [Figure 155](#).

**Figure 155. Comparator block diagram**

### 22.3.2 COMP pins and internal signals

The I/Os used as comparators inputs must be configured in analog mode in the GPIOs registers.

The comparator output can be connected to the I/Os using the alternate function channel given in “Alternate function mapping” table in the datasheet.

The output can also be internally redirected to a variety of timer input for the following purposes:

- Emergency shut-down of PWM signals, using BKIN and BKIN2 inputs
- Cycle-by-cycle current control, using OCREF\_CLR inputs
- Input capture for timing measures

It is possible to have the comparator output simultaneously redirected internally and externally.

**Table 144. COMP1 input plus assignment**

| COMP1_INP | COMP1_INPSEL |
|-----------|--------------|

| $\frac{1}{4} V_{REFINT}$ | 000               |
| $\frac{1}{2} V_{REFINT}$ | 001               |
| $\frac{3}{4} V_{REFINT}$ | 010               |
| $V_{REFINT}$             | 011               |
| DAC Channel1             | 100               |
| DAC Channel2             | 101               |
| PB3                      | 110               |
| PB7                      | 111               |

### 22.3.3 COMP reset and clocks

The COMP clock provided by the clock controller is synchronous with the APB2 clock.

There is no clock enable control bit provided in the RCC controller. Reset and clock enable bits are common for COMP and SYSCFG.

**Important:** The polarity selection logic and the output redirection to the port works independently from the APB2 clock. This allows the comparator to work even in Stop mode.

### 22.3.4 Comparator LOCK mechanism

The comparators can be used for safety purposes, such as over-current or thermal protection. For applications having specific functional safety requirements, it is necessary to insure that the comparator programming cannot be altered in case of spurious register access or program counter corruption.

For this purpose, the comparator control and status registers can be write-protected (read-only).

Once the programming is completed, the COMPx LOCK bit can be set to 1. This causes the whole register to become read-only, including the COMPx LOCK bit.

The write protection can only be reset by a MCU reset.

### 22.3.5 Window comparator

The purpose of window comparator is to monitor the analog voltage if it is within specified voltage range defined by lower and upper threshold.

Two embedded comparators can be utilized to create window comparator. The monitored analog voltage is connected to the non-inverting (plus) inputs of comparators connected together and the upper and lower threshold voltages are connected to the inverting (minus) inputs of the comparators. Two non-inverting inputs can be connected internally together by enabling WINMODE bit to save one IO for other purposes.

**Figure 156. Window mode**

### 22.3.6 Hysteresis

The comparator includes a programmable hysteresis to avoid spurious output transitions in case of noisy signals. The hysteresis can be disabled if it is not needed (for instance when exiting from low-power mode) to be able to force the hysteresis value using external components.

Figure 157. Comparator hysteresis

### 22.3.7 Comparator output blanking function

The purpose of the blanking function is to prevent the current regulation to trip upon short current spikes at the beginning of the PWM period (typically the recovery current in power switches anti parallel diodes). It consists of a selection of a blanking window which is a timer output compare signal. The selection is done by software (refer to the comparator register description for possible blanking signals). Then, the complementary of the blanking signal is ANDed with the comparator output to provide the wanted comparator output. See the example provided in the figure below.

Figure 158. Comparator output blanking

### 22.3.8 COMP power and speed modes

COMP1 and COMP2 power consumption versus propagation delay can be adjusted to have the optimum trade-off for a given application.

The bits PWRMODE[1:0] in COMPx\_CSR registers can be programmed as follows:

- 00: High speed / full power
- 01 or 10: Medium speed / medium power
- 11: Low speed / ultra-low-power

## 22.4 COMP low-power modes

**Table 148. Comparator behavior in the low power modes**

| Mode            | Description                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------|
| Sleep           | No effect on the comparators.<br>Comparator interrupts cause the device to exit the Sleep mode.       |
| Low-power run   | No effect.                                                                                            |
| Low-power sleep | No effect. COMP interrupts cause the device to exit the Low-power sleep mode.                         |
| Stop 0          | No effect on the comparators.<br>Comparator interrupts cause the device to exit the Stop mode.        |
| Stop 1          |                                                                                                       |
| Stop 2          |                                                                                                       |
| Standby         | The COMP registers are powered down and must be reinitialized after exiting Standby or Shutdown mode. |
| Shutdown        |                                                                                                       |

## 22.5 COMP interrupts

The comparator outputs are internally connected to the Extended interrupts and events controller. Each comparator has its own EXTI line and can generate either interrupts or events. The same mechanism is used to exit from low-power modes.

Refer to Interrupt and events section for more details.

To enable COMPx interrupt, it is required to follow this sequence:

1. Configure and enable the EXTI line corresponding to the COMPx output event in interrupt mode and select the rising, falling or both edges sensitivity
2. Configure and enable the NVIC IRQ channel mapped to the corresponding EXTI lines
3. Enable COMPx.

Table 149. Interrupt control bits

| Interrupt event | Event flag         | Enable control bit | Exit from Sleep mode | Exit from Stop modes | Exit from Standby mode |
|-----------------|--------------------|--------------------|----------------------|----------------------|------------------------|
| COMP1 output    | VALUE in COMP1_CSR | Through EXTI       | Yes                  | Yes                  | N/A                    |
| COMP2 output    | VALUE in COMP2_CSR | Through EXTI       | Yes                  | Yes                  | N/A                    |

## 22.6 COMP registers

### 22.6.1 Comparator 1 control and status register (COMP1\_CSR)

The COMP1\_CSR is the Comparator 1 control/status register. It contains all the bits /flags related to comparator1.

Address offset: 0x00

System reset value: 0x0000 0000

|          |       |      |      |      |      |      |      |          |             |      |               |              |    |           |    |
|----------|-------|------|------|------|------|------|------|----------|-------------|------|---------------|--------------|----|-----------|----|

Bit 31 **LOCK**: COMP1\_CSR register lock bit

This bit is set by software and cleared by a hardware system reset. It locks the whole content of the comparator 1 control register, COMP1\_CSR[31:0].

0: COMP1\_CSR[31:0] for comparator 1 are read/write

1: COMP1\_CSR[31:0] for comparator 1 are read-only

Bit 30 **VALUE**: Comparator 1 output status bit

This bit is read-only. It reflects the current comparator 1 output taking into account POLARITY bit effect.

Bits 29: Reserved, must be kept at reset value.

Bit 23 **SCALEN**: Voltage scaler enable bit

This bit is set and cleared by software. This bit enable the outputs of the  $V_{REFINT}$  divider available on the minus input of the Comparator 1.

0: Bandgap scaler disable (if SCALEN bit of COMP2\_CSR register is also reset)

1: Bandgap scaler enable

Bit 22 **BRGEN**: Scaler bridge enable

This bit is set and cleared by software (only if LOCK not set). This bit enable the bridge of the scaler.

0: Scaler resistor bridge disable (if BRGEN bit of COMP2\_CSR register is also reset)

1: Scaler resistor bridge enable

If SCALEN is set and BRGEN is reset, BG voltage reference is available but not 1/4 BGAP, 1/2 BGAP, 3/4 BGAP. BGAP value is sent instead of 1/4 BGAP, 1/2 BGAP, 3/4 BGAP.

If SCALEN and BRGEN are set, 1/4 BGAP 1/2 BGAP 3/4 BGAP and BGAP voltage references are available.

Bit 21 Reserved, must be kept at reset value.

Bits 20:18 **BLANKING[2:0]**: Comparator 1 blanking source selection bits

These bits select which timer output controls the comparator 1 output blanking.

000: No blanking

001: TIM1 OC5 selected as blanking source

010: TIM2 OC3 selected as blanking source

All other values: reserved

Bits 17:16 **HYST[1:0]**: Comparator 1 hysteresis selection bits

These bits are set and cleared by software (only if LOCK not set). They select the hysteresis voltage of the comparator 1.

00: No hysteresis

01: Low hysteresis

10: Medium hysteresis

11: High hysteresis

Bit 15 **POLARITY**: Comparator 1 polarity selection bit

This bit is set and cleared by software (only if LOCK not set). It inverts Comparator 1 polarity.

0: Comparator 1 output value not inverted

1: Comparator 1 output value inverted

Bits 14: Reserved, must be kept at reset value.

Bit 7 **INPSEL**: Comparator1 input plus selection bit

This bit is set and cleared by software (only if LOCK not set).

0: external IO - PC5

1: PB2

Bits 6:4 **INMSEL[2:0]**: Comparator 1 input minus selection bits

These bits are set and cleared by software (only if LOCK not set). They select which input is connected to the input minus of comparator 1.

000 = 1/4  $V_{REFINT}$

001 = 1/2  $V_{REFINT}$

010 = 3/4  $V_{REFINT}$

011 =  $V_{REFINT}$

100 = DAC Channel1

101 = DAC Channel2

110 = PB1111 = PC4

Bits 3:2 **PWRMODE[1:0]**: Power Mode of the comparator 1

These bits are set and cleared by software (only if LOCK not set). They control the power/speed of the Comparator 1.

00: High speed

01 or 10: Medium speed

11: Ultra low power

Bit 1 Reserved, must be kept at reset value.

Bit 0 **EN**: Comparator 1 enable bit

This bit is set and cleared by software (only if LOCK not set). It switches on Comparator1.

0: Comparator 1 switched OFF

1: Comparator 1 switched ON

## 22.6.2 Comparator 2 control and status register (COMP2\_CSR)

The COMP2\_CSR is the Comparator 2 control/status register. It contains all the bits /flags related to comparator 2.

Address offset: 0x04

System reset value: 0x0000 0000

|              |       |      |      |      |      |             |      |            |             |      |               |              |    |           |    |

Bit 31 **LOCK**: CSR register lock bit

This bit is set by software and cleared by a hardware system reset. It locks the whole content of the comparator 2 control register, COMP2\_CSR[31:0].

0: COMP2\_CSR[31:0] for comparator 2 are read/write

1: COMP2\_CSR[31:0] for comparator 2 are read-only

Bit 30 **VALUE**: Comparator 2 output status bit

This bit is read-only. It reflects the current comparator 2 output taking into account POLARITY bit effect.

Bits 29: Reserved, must be kept at reset value.

Bit 23 **SCALEN**: Voltage scaler enable bit

This bit is set and cleared by software. This bit enable the outputs of the  $V_{REFINT}$  divider available on the minus input of the Comparator 2.

0: Bandgap scaler disable (if SCALEN bit of COMP1\_CSR register is also reset)

1: Bandgap scaler enable

Bit 22 **BRGEN**: Scaler bridge enable

This bit is set and cleared by software (only if LOCK not set). This bit enable the bridge of the scaler.

0: Scaler resistor bridge disable (if BRGEN bit of COMP1\_CSR register is also reset)

1: Scaler resistor bridge enable

If SCALEN is set and BRGEN is reset, BG voltage reference is available but not 1/4 BGAP, 1/2 BGAP, 3/4 BGAP. BGAP value is sent instead of 1/4 BGAP, 1/2 BGAP, 3/4 BGAP.

If SCALEN and BRGEN are set, 1/4 BGAP 1/2 BGAP 3/4 BGAP and BGAP voltage references are available.

Bit 21 Reserved, must be kept at reset value.

Bits 20:18 **BLANKING[2:0]**: Comparator 2 blanking source selection bits

These bits select which timer output controls the comparator 2 output blanking.

000: No blanking

100: TIM15 OC1 selected as blanking source

All other values: reserved

Bits 17:16 **HYST[1:0]**: Comparator 2 hysteresis selection bits

These bits are set and cleared by software (only if LOCK not set). Select the hysteresis voltage of the comparator 2.

00: No hysteresis

01: Low hysteresis

10: Medium hysteresis

11: High hysteresis

Bit 15 **POLARITY**: Comparator 2 polarity selection bit

This bit is set and cleared by software (only if LOCK not set). It inverts Comparator 2 polarity.

0: Comparator 2 output value not inverted

1: Comparator 2 output value inverted

Bits 14:10 Reserved, must be kept at reset value.

Bit 9 **WINMODE**: Windows mode selection bit

This bit is set and cleared by software (only if LOCK not set). This bit selects the window mode of the comparators. If set, both positive inputs of comparators are connected together.

0: Input plus of Comparator 2 is not connected to Comparator 1

1: Input plus of Comparator 2 is connected with input plus of Comparator 1

Bit 8 Reserved, must be kept at reset value.

Bit 7 **INPSEL**: Comparator 1 input plus selection bit

This bit is set and cleared by software (only if LOCK not set).

0: PB4

1: PB6

Bits 6:4 **INMSEL[2:0]**: Comparator 2 input minus selection bits

These bits are set and cleared by software (only if LOCK not set). They select which input is connected to the input minus of comparator 2.

000 =  $1/4 V_{REFINT}$

001 =  $1/2 V_{REFINT}$

010 =  $3/4 V_{REFINT}$

011 =  $V_{REFINT}$

100 = DAC Channel1

101 = DAC Channel2

110 = PB3

111 = PB7

Bits 3:2 **PWRMODE[1:0]**: Power Mode of the comparator 2

These bits are set and cleared by software (only if LOCK not set). They control the power/speed of the Comparator 2.

00: High speed

01 or 10: Medium speed

11: Ultra low power

Bit 1 Reserved, must be kept at reset value.

Bit 0 **EN**: Comparator 2 enable bit

This bit is set and cleared by software (only if LOCK not set). It switches on comparator2.

0: Comparator 2 switched OFF

1: Comparator 2 switched ON

### 22.6.3 COMP register map

The following table summarizes the comparator registers.

**Table 150. COMP register map and reset values**

| Offset | Register    | 31   | 30    | 29   | 28   | 27   | 26   | 25   | 24   | 23    | 22     | 21   | 20       | 19 | 18 | 17   | 16 | 15        | 14   | 13   | 12   | 11   | 10   | 9       | 8       | 7      | 6      | 5      | 4 | 3       | 2       | 1    | 0    |    |
|--------|-------------|------|-------|------|------|------|------|------|------|-------|--------|------|----------|----|----|------|----|-----------|------|------|------|------|------|---------|---------|--------|--------|--------|---|---------|---------|------|------|----|

Refer to [Section 2.2 on page 75](#) for the register boundary addresses.

## 23 Operational amplifiers (OPAMP)

### 23.1 Introduction

The device embeds two operational amplifiers with two inputs and one output each. The three I/Os can be connected to the external pins, this enables any type of external interconnections. The operational amplifier can be configured internally as a follower or as an amplifier with a non-inverting gain ranging from 2 to 16.

The positive input can be connected to the internal DAC.

The output can be connected to the internal ADC.

### 23.2 OPAMP main features

- Rail-to-rail input voltage range
- Low input bias current (down to 1 nA)
- Low input offset voltage (1.5 mV after calibration, 3 mV with factory calibration)
- Low-power mode (current consumption reduced to 30  $\mu$ A instead of 100  $\mu$ A)
- Fast wakeup time (10  $\mu$ s in normal mode, 30  $\mu$ s in low-power mode)
- Gain bandwidth of 1.6 MHz

### 23.3 OPAMP functional description

The OPAMP has several modes.

Each OPAMP can be individually enabled, when disabled the output is high-impedance.

When enabled, it can be in calibration mode, all input and output of the OPAMP are then disconnected, or in functional mode.

There are two functional modes, the low-power mode or the normal mode. In functional mode the inputs and output of the OPAMP are connected as described in the [Section 23.3.3: Signal routing](#).

#### 23.3.1 OPAMP reset and clocks

The operational amplifier clock is necessary for accessing the registers. When the application does not need to have read or write access to those registers, the clock can be switched off using the peripheral clock enable register (see OPAEN bit in [Section 6.4.19: APB1 peripheral clock enable register 1 \(RCC\\_APB1ENR1\)](#)).

The bit OPAEN enables and disables the OPAMP operation. The OPAMP registers configurations should be changed before enabling the OPAEN bit in order to avoid spurious effects on the output.

When the output of the operational amplifier is no more needed the operational amplifier can be disabled to save power. All the configurations previously set (including the calibration) are maintained while OPAMP is disabled.

### 23.3.2 Initial configuration

The default configuration of the operational amplifier is a functional mode where the three IOs are connected to external pins. In the default mode the operational amplifier uses the factory trimming values. See electrical characteristics section of the datasheet for factory trimming conditions, usually the temperature is 30 °C and the voltage is 3 V. The trimming values can be adjusted, see [Section 23.3.5: Calibration](#) for changing the trimming values. The default configuration uses the normal mode, which provides the highest performance. Bit OPALPM can be set in order to switch the operational amplifier to low-power mode and reduced performance. Both normal and low-power mode characteristics are defined in the section “electrical characteristics” of the datasheet. Before utilization, the bit OPA\_RANGE of OPAMP\_CSR must be set to 1 if  $V_{DDA}$  is above 2.4V, or kept at 0 otherwise.

As soon as the OPAEN bit in OPAMP\_CSR register is set, the operational amplifier is functional. The two input pins and the output pin are connected as defined in [Section 23.3.3: Signal routing](#) and the default connection settings can be changed.

*Note:* The inputs and output pins must be configured in analog mode (default state) in the corresponding GPIOx\_MODER register.

### 23.3.3 Signal routing

The routing for the operational amplifier pins is determined by OPAMP\_CSR register.

The connections of the two operational amplifiers (OPAMP1 and OPAMP2) are described in the table below.

**Table 151. Operational amplifier possible connections**

| Signal      | Pin                                 | Internal               | comment                                                                                   |
|-------------|-------------------------------------|------------------------|-------------------------------------------------------------------------------------------|
| OPAMP1_VINM | PA1 or dedicated pin <sup>(1)</sup> | OPAMP1_OUT<br>or PGA   | controlled by bits OPAMODE<br>and VM_SEL.                                                 |
| OPAMP1_VINP | PA0                                 | DAC1_OUT1              | controlled by bit VP_SEL.                                                                 |
| OPAMP1_VOUT | PA3                                 | ADC1_IN8<br>ADC2_IN8   | The pin is connected when the<br>OPAMP is enabled. The ADC<br>input is controlled by ADC. |
| OPAMP2_VINM | PA7 or dedicated pin <sup>(1)</sup> | OPAMP2_OUT<br>or PGA   | controlled by bits OPAMODE<br>and VM_SEL.                                                 |
| OPAMP2_VINP | PA6                                 | DAC1_OUT2              | controlled by bit VP_SEL                                                                  |
| OPAMP2_VOUT | PB0                                 | ADC1_IN15<br>ADC2_IN15 | The pin is connected when the<br>OPAMP is enabled. The ADC<br>input is controlled by ADC. |

1. The dedicated pin is only available on BGA132 and BGA169 (for STM32L49x/L4Ax devices) package. This configuration provides the lowest input bias current (see datasheet).

### 23.3.4 OPAMP modes

The operational amplifier inputs and outputs are all accessible on terminals. The amplifiers can be used in multiple configuration environments:

- Standalone mode (external gain setting mode)
- Follower configuration mode
- PGA modes

**Note:** The amplifier output pin is directly connected to the output pad to minimize the output impedance. It cannot be used as a general purpose I/O, even if the amplifier is configured as a PGA and only connected to the ADC channel.

**Note:** The impedance of the signal must be maintained below a level which avoids the input leakage to create significant artifacts (due to a resistive drop in the source). Please refer to the electrical characteristics section in the datasheet for further details.

#### Standalone mode (external gain setting mode)

The procedure to use the OPAMP in standalone mode is presented hereafter.

Starting from the default value of OPAMP\_CSR, and the default state of GPIOx\_MODER, configure bit OPA\_RANGE according the  $V_{DDA}$  voltage. As soon as the OPAEN bit is set, the two input pins and the output pin are connected to the operational amplifier.

This default configuration uses the factory trimming values and operates in normal mode (highest performance). The behavior of the OPAMP can be changed as follows:

- OPALPM can be set to “operational amplifier low-power” mode in order to save power.
- USERTRIM can be set to modify the trimming values for the input offset.

**Figure 159. Standalone mode: external gain setting mode**

### Follower configuration mode

The procedure to use the OPAMP in follower mode is presented hereafter.

- configure OPAMODE bits as “internal follower”
- configure VP\_SEL bits as “GPIO connected to VINP”.
- As soon as the OPAEN bit is set, the signal on pin OPAMP\_VINP is copied to pin OPAMP\_VOUT.

*Note:* The pin corresponding to OPAMP\_VINM is free for another usage.

*Note:* The signal on the operational amplifier output is also seen as an ADC input. As a consequence, the OPAMP configured in follower mode can be used to perform impedance adaptation on input signals before feeding them to the ADC input, assuming the input signal frequency is compatible with the operational amplifier gain bandwidth specification.

**Figure 160. Follower configuration**

### Programmable Gain Amplifier mode

The procedure to use the OPAMP to amplify the amplitude of an input signal is presented hereafter.

- configure OPAMODE bits as “internal PGA enabled”,
- configure PGA\_GAIN bits as “internal PGA Gain 2, 4, 8 or 16”,
- configure VM\_SEL bits as “inverting not externally connected”,
- configure VP\_SEL bits as “GPIO connected to VINP”.

As soon as the OPAEN bit is set, the signal on pin OPAMP\_VINP is amplified by the selected gain and visible on pin OPAMP\_VOUT.

*Note:* To avoid saturation, the input voltage should stay below  $V_{DDA}$  divided by the selected gain.

**Figure 161. PGA mode, internal gain setting (x2/x4/x8/x16), inverting input not used**

### Programmable Gain Amplifier mode with external filtering

The procedure to use the OPAMP to amplify the amplitude of an input signal, with an external filtering, is presented hereafter.

- configure OPAMODE bits as “internal PGA enabled”,
- configure PGA\_GAIN bits as “internal PGA Gain 2, 4, 8 or 16”,
- configure VM\_SEL bits as “GPIO connected to VINM”,
- configure VP\_SEL bits as “GPIO connected to VINP”.

Any external connection on VINP can be used in parallel with the internal PGA, for example a capacitor can be connected between VOUT and VINM for filtering purpose (see datasheet for the value of resistors used in the PGA resistor network).

**Figure 162. PGA mode, internal gain setting (x2/x4/x8/x16), inverting input used for filtering**

1. The gain depends on the cut-off frequency.

### 23.3.5 Calibration

At startup, the trimming values are initialized with the preset ‘factory’ trimming value.

Each operational amplifier offset can be trimmed by the user. Specific registers allow to have different trimming values for normal mode and for low-power mode.

The aim of the calibration is to cancel as much as possible the OPAMP inputs offset voltage. The calibration circuitry allows to reduce the inputs offset voltage to less than  $\pm 1.5$  mV within stable voltage and temperature conditions.

For each operational amplifier and each mode two trimming values need to be trimmed, one for N differential pair and one for P differential pair.

There are two registers for trimming the offsets for each operational amplifiers, one for normal mode (OPAMP\_OTR) and one low-power mode (OPAMP\_LPOTR). Each register is composed of five bits for P differential pair trimming and five bits for N differential pair trimming. These are the ‘user’ values.

The user is able to switch from 'factory' values to 'user' trimmed values using the USERTRIM bit in the OPAMP\_CSR register. This bit is reset at startup and so the 'factory' value are applied by default to the OPAMP trimming registers.

User is liable to change the trimming values in calibration or in functional mode.

The offset trimming registers are typically configured after the calibration operation is initialized by setting bit CALON to 1. When CALON = 1 the inputs of the operational amplifier are disconnected from the functional environment.

- Setting CALSEL to 1 initializes the offset calibration for the P differential pair (low voltage reference used).
- Resetting CALSEL to 0 initializes the offset calibration for the N differential pair (high voltage reference used).

When CALON = 1, the bit CALOUT will reflect the influence of the trimming value selected by CALSEL and OPALPM. When the value of CALOUT switches between two consecutive trimming values, this means that those two values are the best trimming values. The CALOUT flag needs up to 1 ms after the trimming value is changed to become steady (see  $t_{\text{OFFTRIMmax}}$  delay specification in the electrical characteristics section of the datasheet).

*Note: The closer the trimming value is to the optimum trimming value, the longer it takes to stabilize (with a maximum stabilization time remaining below 1 ms in any case).*

**Table 152. Operating modes and calibration**

| Mode                               | Control bits |        |       |        | Output           |             |
|------------------------------------|--------------|--------|-------|--------|------------------|-------------|
|                                    | OPAEN        | OPALPM | CALON | CALSEL | V <sub>OUT</sub> | CALOUT flag |
| Normal operating mode              | 1            | 0      | 0     | X      | analog           | 0           |
| Low-power mode                     | 1            | 1      | 0     | X      | analog           | 0           |
| Power down                         | 0            | X      | X     | X      | Z                | 0           |
| Offset cal high for normal mode    | 1            | 0      | 1     | 0      | analog           | X           |
| Offset cal low for normal mode     | 1            | 0      | 1     | 1      | analog           | X           |
| Offset cal high for low-power mode | 1            | 1      | 1     | 0      | analog           | X           |
| Offset cal low for low-power mode  | 1            | 1      | 1     | 1      | analog           | X           |

### Calibration procedure

Here are the steps to perform a full calibration of either one of the operational amplifiers:

1. Select correct OPA\_RANGE in OPAMP\_CSR, then set the OPAEN bit in OPAMP\_CSR to 1 to enable the operational amplifier.
2. Set the USERTRIM bit in the OPAMP\_CSR register to 1.
3. Choose a calibration mode (refer to [Table 152: Operating modes and calibration](#)). The steps 3 to 4 will have to be repeated 4 times. For the first iteration select
  - Normal mode, offset cal high (N differential pair)
 The above calibration mode correspond to OPALPM=0 and CALSEL=0 in the OPAMP\_CSR register.
4. Increment TRIMOFFSETN[4:0] in OPAMP\_OTR starting from 00000b until CALOUT changes to 1 in OPAMP\_CSR.

*Note:* CALOUT will switch from 0 to 1 for offset cal high and from 1 to 0 for offset cal low.

*Note:* Between the write to the OPAMP\_OTR register and the read of the CALOUT value, make sure to wait for the  $t_{OFFTRIMmax}$  delay specified in the electrical characteristics section of the datasheet, to get the correct CALOUT value.

The commutation means that the offset is correctly compensated and that the corresponding trim code must be saved in the OPAMP\_OTR register.

Repeat steps 3 to 4 for:

- Normal\_mode and offset cal low
- Low power mode and offset cal high
- Low power mode and offset cal low

If a mode is not used it is not necessary to perform the corresponding calibration.

All operational amplifier can be calibrated at the same time.

*Note:* During the whole calibration phase the external connection of the operational amplifier output must not pull up or down currents higher than 500  $\mu$ A.

During the calibration procedure, it is necessary to set up OPAMODE bits as 00 or 01 (PGA disable) or 11 (internal follower).

## 23.4 OPAMP low-power modes

**Table 153. Effect of low-power modes on the OPAMP**

| Mode            | Description                                                                          |
|-----------------|--------------------------------------------------------------------------------------|
| Sleep           | No effect.                                                                           |
| Low-power run   | No effect.                                                                           |
| Low-power sleep | No effect.                                                                           |
| Stop 0 / Stop 1 | No effect, OPAMP registers content is kept.                                          |
| Stop 2          | OPAMP registers content is kept. OPAMP must be disabled before entering Stop 2 mode. |

Table 153. Effect of low-power modes on the OPAMP (continued)

| Mode     | Description                                                                                             |
|----------|---------------------------------------------------------------------------------------------------------|
| Standby  | The OPAMP registers are powered down and must be re-initialized after exiting Standby or Shutdown mode. |
| Shutdown |                                                                                                         |

## 23.5 OPAMP registers

### 23.5.1 OPAMP1 control/status register (OPAMP1\_CSR)

Address offset: 0x00

Reset value: 0x0000 0000

|           |           |         |       |      |        |        |      |      |      |          |      |         |      |         |       |
|-----------|-----------|---------|-------|------|--------|--------|------|------|------|----------|------|---------|------|---------|-------|
| 31        | 30        | 29      | 28    | 27   | 26     | 25     | 24   | 23   | 22   | 21       | 20   | 19      | 18   | 17      | 16    |
| OPA_RANGE | Res.      | Res.    | Res.  | Res. | Res.   | Res.   | Res. | Res. | Res. | Res.     | Res. | Res.    | Res. | Res.    | Res.  |
| rw        |           |         |       |      |        |        |      |      |      |          |      |         |      |         |       |
| 15        | 14        | 13      | 12    | 11   | 10     | 9      | 8    | 7    | 6    | 5        | 4    | 3       | 2    | 1       | 0     |
| CAL_OUT   | USER_TRIM | CAL_SEL | CALON | Res. | VP_SEL | VM_SEL |      | Res. | Res. | PGA_GAIN |      | OPAMODE |      | OPA_LPM | OPAEN |
| r         | rw        | rw      | rw    |      | rw     | rw     | rw   |      |      | rw       | rw   | rw      | w    | rw      | rw    |

Bit 31 **OPA\_RANGE**: Operational amplifier power supply range for stability

All AOP must be in power down to allow AOP-RANGE bit write. It applies to all AOP embedded in the product.

0: Low range ( $V_{DDA} < 2.4V$ )

1: High range ( $V_{DDA} > 2.4V$ )

Bits 30:16 Reserved, must be kept at reset value.

Bit 15 **CALOUT**: Operational amplifier calibration output

During calibration mode offset is trimmed when this signal toggle.

Bit 14 **USERTRIM**: allows to switch from 'factory' AOP offset trimmed values to AOP offset 'user' trimmed values

This bit is active for both mode normal and low-power.

0: 'factory' trim code used

1: 'user' trim code used

Bit 13 **CALSEL**: Calibration selection

0: NMOS calibration (200mV applied on OPAMP inputs)

1: PMOS calibration ( $V_{DDA}$ -200mV applied on OPAMP inputs)

Bit 12 **CALON**: Calibration mode enabled

0: Normal mode

1: Calibration mode (all switches opened by HW)

Bit 11 Reserved, must be kept at reset value.

Bit 10 **VP\_SEL**: Non inverted input selection

0: GPIO connected to VINP

1: DAC connected to VINP

Bits 9:8 **VM\_SEL**: Inverting input selection

These bits are used only when OPAMODE = 00, 01 or 10.

00: GPIO connected to VINM (valid also in PGA mode for filtering)

01: Dedicated low leakage input, (available only on BGA132 and BGA169 for STM32L49x/L4Ax devices) connected to VINM (valid also in PGA mode for filtering)

1x: Inverting input not externally connected. These configurations are valid only when OPAMODE = 10 (PGA mode)

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **PGA\_GAIN**: Operational amplifier Programmable amplifier gain value

00: internal PGA Gain 2

01: internal PGA Gain 4

10: internal PGA Gain 8

11: internal PGA Gain 16

Bits 3:2 **OPAMODE**: Operational amplifier PGA mode

00: internal PGA disable

01: internal PGA disable

10: internal PGA enable, gain programmed in PGA\_GAIN

11: internal follower

Bit 1 **OPALPM**: Operational amplifier Low Power Mode

The operational amplifier must be disable to change this configuration.

0: operational amplifier in normal mode

1: operational amplifier in low-power mode

Bit 0 **OPAEN**: Operational amplifier Enable

0: operational amplifier disabled

1: operational amplifier enabled

### 23.5.2 OPAMP1 offset trimming register in normal mode (OPAMP1\_OTR)

Address offset: 0x04

Reset value: 0x0000 XXXX (factory trimmed values)

|      |      |      |             |      |      |      |      |      |      |      |             |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **CALOUT**: Operational amplifier calibration output

During calibration mode offset is trimmed when this signal toggle.

Bit 14 **USERTRIM**: allows to switch from 'factory' AOP offset trimmed values to AOP offset 'user' trimmed values

This bit is active for both mode normal and low-power.

0: 'factory' trim code used

1: 'user' trim code used

Bit 13 **CALSEL**: Calibration selection

0: NMOS calibration (200mV applied on OPAMP inputs)

1: PMOS calibration (VDDA-200mV applied on OPAMP inputs)

Bit 12 **CALON**: Calibration mode enabled

0: Normal mode

1: Calibration mode (all switches opened by HW)

Bit 11 Reserved, must be kept at reset value.

Bit 10 **VP\_SEL**: Non inverted input selection

0: GPIO connected to VINP

1: DAC connected to VINP

Bits 9:8 **VM\_SEL**: Inverting input selection

These bits are used only when OPAMODE = 00, 01 or 10.

00: GPIO connected to VINM (valid also in PGA mode for filtering)

01: Dedicated low leakage input, (available only on BGA132) connected to VINM (valid also in PGA mode for filtering)

1x: Inverting input not externally connected. These configurations are valid only when OPAMODE = 10 (PGA mode)

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **PGA\_GAIN**: Operational amplifier Programmable amplifier gain value

00: internal PGA Gain 2

01: internal PGA Gain 4

10: internal PGA Gain 8

11: internal PGA Gain 16

Bits 3:2 **OPAMODE**: Operational amplifier PGA mode

00: internal PGA disable

01: internal PGA disable

10: internal PGA enable, gain programmed in PGA\_GAIN

11: internal follower

Bit 1 **OPALPM**: Operational amplifier Low Power Mode

The operational amplifier must be disable to change this configuration.

0: operational amplifier in normal mode

1: operational amplifier in low-power mode

Bit 0 **OPAEN**: Operational amplifier Enable

0: operational amplifier disabled

1: operational amplifier enabled

### 23.5.5 OPAMP2 offset trimming register in normal mode (OPAMP2\_OTR)

Address offset: 0x14

Reset value: 0x0000 XXXX (factory trimmed values)

## 24 Digital filter for sigma delta modulators (DFSDM)

### 24.1 Introduction

Digital filter for sigma delta modulators (DFSDM) is a high-performance module dedicated to interface external  $\Sigma\Delta$  modulators. It is featuring up to 8 external digital serial interfaces (channels) and up to 4 digital filters with flexible Sigma Delta stream digital processing options to offer up to 24-bit final ADC resolution. DFSDM also features optional parallel data stream input from internal ADC peripherals<sup>(a)</sup> or from device memory.

An external  $\Sigma\Delta$  modulator provides digital data stream of converted analog values from the external  $\Sigma\Delta$  modulator analog input. This digital data stream is sent into a DFSDM input channel through a serial interface. DFSDM supports several standards to connect various  $\Sigma\Delta$  modulator outputs: SPI interface and Manchester coded 1-wire interface (both with adjustable parameters). DFSDM module supports the connection of up to 8 multiplexed input digital serial channels which are shared with up to 4 DFSDM modules. DFSDM module also supports alternative parallel data inputs from up to 8 internal 16-bit data channels (from internal ADCs<sup>(a)</sup> or from device memory).

DFSDM is converting an input data stream into a final digital data word which represents an analog input value on a  $\Sigma\Delta$  modulator analog input. The conversion is based on a configurable digital process: the digital filtering and decimation of the input serial data stream.

The conversion speed and resolution are adjustable according to configurable parameters for digital processing: filter type, filter order, length of filter, integrator length. The maximum output data resolution is up to 24 bits. There are two conversion modes: single conversion mode and continuous mode. The data can be automatically stored in a system RAM buffer through DMA, thus reducing the software overhead.

A flexible timer triggering system can be used to control the start of conversion of DFSDM. This timing control is capable of triggering simultaneous conversions or inserting a programmable delay between conversions.

DFSDM features an analog watchdog function. Analog watchdog can be assigned to any of the input channel data stream or to final output data. Analog watchdog has its own digital filtering of input data stream to reach the required speed and resolution of watched data.

To detect short-circuit in control applications, there is a short-circuit detector. This block watches each input channel data stream for occurrence of stable data for a defined time duration (several 0's or 1's in an input data stream).

An extremes detector block watches final output data and stores maximum and minimum values from the output data values. The extremes values stored can be restarted by software.

Two power modes are supported: normal mode and stop mode.

---

a. Availability of the input from internal ADC is device dependent, see [Table 155: DFSDM1 implementation](#).

## 24.2 DFSDM main features

- Up to 8 multiplexed input digital serial channels:
  - configurable SPI interface to connect various  $\Sigma\Delta$  modulators
  - configurable Manchester coded 1 wire interface support
  - clock output for  $\Sigma\Delta$  modulator(s)
- Alternative inputs from up to 8 internal digital parallel channels:
  - inputs with up to 16 bit resolution
  - internal sources: ADCs data<sup>(a)</sup> or memory (CPU/DMA write) data streams
- Adjustable digital signal processing:
  - Sinc<sup>x</sup> filter: filter order/type (1..5), oversampling ratio (up to 1..1024)
  - integrator: oversampling ratio (1..256)
- Up to 24-bit output data resolution:
  - right bit-shifter on final data (0..31 bits)
- Signed output data format
- Automatic data offset correction (offset stored in register by user)
- Continuous or single conversion
- Start-of-conversion synchronization with:
  - software trigger
  - internal timers
  - external events
  - start-of-conversion synchronously with first DFSDM filter (DFSDM\_FLT0)
- Analog watchdog feature:
  - low value and high value data threshold registers
  - own configurable Sinc<sup>x</sup> digital filter (order = 1..3, oversampling ratio = 1..32)
  - input from output data register or from one or more input digital serial channels
  - continuous monitoring independently from standard conversion
- Short-circuit detector to detect saturated analog input values (bottom and top ranges):
  - up to 8-bit counter to detect 1..256 consecutive 0's or 1's on input data stream
  - monitoring continuously each channel (8 serial channel transceiver outputs)
- Break generation on analog watchdog event or short-circuit detector event
- Extremes detector:
  - store minimum and maximum values of output data values
  - refreshed by software
- DMA may be used to read the conversion data
- Interrupts: end of conversion, overrun, analog watchdog, short-circuit, channel clock absence
- “regular” or “injected” conversions:
  - “regular” conversions can be requested at any time or even in continuous mode without having any impact on the timing of “injected” conversions

---

a. Availability of the input from internal ADC is device dependent, see [Table 155: DFSDM1 implementation](#).

- “injected” conversions for precise timing and with high conversion priority

## 24.3 DFSDM implementation

This section describes the configuration implemented in DFSDMx.

**Table 155. DFSDM1 implementation**

| DFSDM features            | DFSDM1            |
|---------------------------|-------------------|
| Number of channels        | 8                 |
| Number of filters         | 4                 |
| Input from internal ADC   | X <sup>(1)</sup>  |
| Supported trigger sources | 11 <sup>(2)</sup> |
| Pulses skipper            | -                 |

1. For STM32L49x/L4Ax devices only.

2. Refer to [Table 158: DFSDM triggers connection](#) for available trigger sources.

## 24.4 DFSDM functional description

### 24.4.1 DFSDM block diagram

Figure 163. Single DFSDM block diagram

is device dependent, see [Table 155: DFSDM1 implementation](#).

## 24.4.2 DFSDM pins and internal signals

**Table 156. DFSDM external pins**

| Name       | Signal Type             | Remarks                                                                                      |
|------------|-------------------------|----------------------------------------------------------------------------------------------|
| VDD        | Power supply            | Digital power supply.                                                                        |
| VSS        | Power supply            | Digital ground power supply.                                                                 |
| CKIN[7:0]  | Clock input             | Clock signal provided from external $\Sigma\Delta$ modulator. FT input.                      |
| DATIN[7:0] | Data input              | Data signal provided from external $\Sigma\Delta$ modulator. FT input.                       |
| CKOUT      | Clock output            | Clock output to provide clock signal into external $\Sigma\Delta$ modulator.                 |
| EXTRG[1:0] | External trigger signal | Input trigger from two EXTI signals to start analog conversion (from GPIOs: EXTI11, EXTI15). |

**Table 157. DFSDM internal signals**

| Name                               | Signal Type                      | Remarks                                                                                                                     |

| dfsdm_break[2] | TIM8 break        |
| dfsdm_break[3] | TIM8 break2       |

### 24.4.3 DFSDM reset and clocks

#### DFSDM on-off control

The DFSDM interface is globally enabled by setting DFSDMEN=1 in the DFSDM\_CH0CFGR1 register. Once DFSDM is globally enabled, all input channels (y=0..7) and digital filters DFSDM\_FLTx (x=0..3) start to work if their enable bits are set (channel enable bit CHEN in DFSDM\_CHyCFGR1 and DFSDM\_FLTx enable bit DFEN in DFSDM\_FLTxCR1).

Digital filter x DFSDM\_FLTx (x=0..3) is enabled by setting DFEN=1 in the DFSDM\_FLTxCR1 register. Once DFSDM\_FLTx is enabled (DFEN=1), both Sinc<sup>x</sup> digital filter unit and integrator unit are reinitialized.

By clearing DFEN, any conversion which may be in progress is immediately stopped and DFSDM\_FLTx is put into stop mode. All register settings remain unchanged except DFSDM\_FLTxAWSR and DFSDM\_FLTxISR (which are reset).

Channel y (y=0..7) is enabled by setting CHEN=1 in the DFSDM\_CHyCFGR1 register. Once the channel is enabled, it receives serial data from the external  $\Sigma\Delta$  modulator or parallel internal data sources (ADCs<sup>(a)</sup> or CPU/DMA wire from memory).

DFSDM must be globally disabled (by DFSDMEN=0 in DFSDM\_CH0CFGR1) before stopping the system clock to enter in the STOP mode of the device.

a. Availability of the input from internal ADC is device dependent, see Table 231: DFSDM1 implementation.

### DFSDM clocks

The internal DFSDM clock  $f_{\text{DFSDMCLK}}$ , which is used to drive the channel transceivers, digital processing blocks (digital filter, integrator) and next additional blocks (analog watchdog, short-circuit detector, extremes detector, control block) is generated by the RCC block and is derived from the system clock SYSCLK or peripheral clock PCLK2 (see [Section 6.4.28: Peripherals independent clock configuration register \(RCC\\_CCIPR\)](#)). The DFSDM clock is automatically stopped in stop mode (if DFEN = 0 for all DFSDM\_FLTx, x=0..3).

The DFSDM serial channel transceivers can receive an external serial clock to sample an external serial data stream. The internal DFSDM clock must be at least 4 times faster than the external serial clock if standard SPI coding is used, and 6 times faster than the external serial clock if Manchester coding is used.

DFSDM can provide one external output clock signal to drive external  $\Sigma\Delta$  modulator(s) clock input(s). It is provided on CKOUT pin. This output clock signal must be in the range specified in given device datasheet and is derived from DFSDM clock or from audio clock (see CKOUTSRC bit in DFSDM\_CH0CFGR1 register) by programmable divider in the range 2 - 256 (CKOUTDIV in DFSDM\_CH0CFGR1 register). Audio clock source is SAI1 clock selected by SAI1SEL[1:0] field in RCC configuration (see [Section 6.4.28: Peripherals independent clock configuration register \(RCC\\_CCIPR\)](#)).

#### 24.4.4 Serial channel transceivers

There are 8 multiplexed serial data channels which can be selected for conversion by each filter or Analog watchdog or Short-circuit detector. Those serial transceivers receive data stream from external  $\Sigma\Delta$  modulator. Data stream can be sent in SPI format or Manchester coded format (see SITP[1:0] bits in DFSDM\_CHyCFGR1 register). The channel is enabled for operation by setting CHEN=1 in DFSDM\_CHyCFGR1 register.

##### Channel inputs selection

Serial inputs (data and clock signals) from DATINy and CKINy pins can be redirected from the following channel pins. This serial input channel redirection is set by CHINSEL bit in DFSDM\_CHyCFGR1 register.

Channel redirection can be used to collect audio data from PDM (pulse density modulation) stereo microphone type. PDM stereo microphone has one data and one clock signal. Data signal provides information for both left and right audio channel (rising clock edge samples for left channel and falling clock edge samples for right channel).

Configuration of serial channels for PDM microphone input:

- PDM microphone signals (data, clock) will be connected to DFSDM input serial channel  $y$  (DATIN $_y$ , CKOUT) pins.
- Channel  $y$  will be configured: CHINSEL = 0 (input from given channel pins: DATIN $_y$ , CKIN $_y$ ).
- Channel  $(y-1)$  (modulo 8) will be configured: CHINSEL = 1 (input from the following channel  $((y-1)+1)$  pins: DATIN $_y$ , CKIN $_y$ ).
- Channel  $y$ : SITP[1:0] = 0 (rising edge to strobe data) => left audio channel on channel  $y$ .
- Channel  $(y-1)$ : SITP[1:0] = 1 (falling edge to strobe data) => right audio channel on channel  $y-1$ .
- Two DFSDM filters will be assigned to channel  $y$  and channel  $(y-1)$  (to filter left and right channels from PDM microphone).

**Figure 164. Input channel pins redirection**

## Output clock generation

A clock signal can be provided on CKOUT pin to drive external  $\Sigma\Delta$  modulator clock inputs. The frequency of this CKOUT signal is derived from DFSDM clock or from audio clock (see CKOUTSRC bit in DFSDM\_CH0CFGR1 register) divided by a predivider (see CKOUTDIV bits in DFSDM\_CH0CFGR1 register). If the output clock is stopped, then CKOUT signal is set to low state (output clock can be stopped by CKOUTDIV=0 in DFSDM\_CHyCFGR1 register or by DFSDMEN=0 in DFSDM\_CH0CFGR1 register). The output clock stopping is performed:

- 4 system clocks after DFSDMEN is cleared (if CKOUTSRC=0)
- 1 system clock and 3 audio clocks after DFSDMEN is cleared (if CKOUTSRC=1)

Before changing CKOUTSRC the software has to wait for CKOUT being stopped to avoid glitch on CKOUT pin. The output clock signal frequency must be in the range 0 - 20 MHz.

## SPI data input format operation

In SPI format, the data stream is sent in serial format through data and clock signals. Data signal is always provided from DATINy pin. A clock signal can be provided externally from CKINy pin or internally from a signal derived from the CKOUT signal source.

In case of external clock source selection (SPICKSEL[1:0]=0) data signal (on DATINy pin) is sampled on rising or falling clock edge (of CKINy pin) according SITP[1:0] bits setting (in DFSDM\_CHyCFGR1 register).

Internal clock sources - see SPICKSEL[1:0] in DFSDM\_CHyCFGR1 register:

- CKOUT signal:
  - For connection to external  $\Sigma\Delta$  modulator which uses directly its clock input (from CKOUT) to generate its output serial communication clock.
  - Sampling point: on rising/falling edge according SITP[1:0] setting.
- CKOUT/2 signal (generated on CKOUT rising edge):
  - For connection to external  $\Sigma\Delta$  modulator which divides its clock input (from CKOUT) by 2 to generate its output serial communication clock (and this output clock change is active on each clock input rising edge).
  - Sampling point: on each second CKOUT falling edge.
- CKOUT/2 signal (generated on CKOUT falling edge):
  - For connection to external  $\Sigma\Delta$  modulator which divides its clock input (from CKOUT) by 2 to generate its output serial communication clock (and this output clock change is active on each clock input falling edge).
  - Sampling point: on each second CKOUT rising edge.

*Note:* An internal clock source can only be used when the external  $\Sigma\Delta$  modulator uses CKOUT signal as a clock input (to have synchronous clock and data operation).

Internal clock source usage can save CKINy pin connection (CKINy pins can be used for other purpose).

The clock source signal frequency must be in the range 0 - 20 MHz for SPI coding and less than  $f_{DFSDMCLK}/4$ .

## Manchester coded data input format operation

In Manchester coded format, the data stream is sent in serial format through DATINy pin only. Decoded data and clock signal are recovered from serial stream after Manchester

decoding. There are two possible settings of Manchester codings (see SITP[1:0] bits in DFSDM\_CHyCFGR1 register):

- signal rising edge = log 0; signal falling edge = log 1
- signal rising edge = log 1; signal falling edge = log 0

The recovered clock signal frequency for Manchester coding must be in the range 0 - 10 MHz and less than  $f_{\text{DFSDMCLK}}/6$ .

To correctly receive Manchester coded data, the CKOUTDIV divider (in DFSDM\_CH0CFGR1 register) must be set with respect to expected Manchester data rate according formula:

$$((\text{CKOUTDIV} + 1) \times T_{\text{SYSCLK}}) < T_{\text{Manchester clock}} < (2 \times \text{CKOUTDIV} \times T_{\text{SYSCLK}})$$

Figure 165. Channel transceiver timing diagrams

### Clock absence detection

Channels serial clock inputs can be checked for clock absence/presence to ensure the correct operation of conversion and error reporting. Clock absence detection can be enabled or disabled on each input channel  $y$  by bit CKABEN in DFSDM\_CHyCFGR1 register. If enabled, then this clock absence detection is performed continuously on a given channel. A clock absence flag is set (CKABF[y] = 1) and an interrupt can be invoked (if CKABIE=1) in case of an input clock error (see CKABF[7:0] in DFSDM\_FLT0ISR register and CKABEN in DFSDM\_CHyCFGR1). After a clock absence flag clearing (by CLRCKABF in DFSDM\_FLT0ICR register), the clock absence flag is refreshed. Clock absence status bit CKABF[y] is set also by hardware when corresponding channel  $y$  is disabled (if CHEN[y] = 0 then CKABF[y] is held in set state).

When a clock absence event has occurred, the data conversion (and/or analog watchdog and short-circuit detector) provides incorrect data. The user should manage this event and discard given data while a clock absence is reported.

The clock absence feature is available only when the system clock is used for the CKOUT signal (CKOUTSRC=0 in DFSDM\_CH0CFGR1 register).

When the transceiver is not yet synchronized, the clock absence flag is set and cannot be cleared by CLRCKABF[y] bit (in DFSDM\_FLT0ICR register). The software sequence concerning clock absence detection feature should be:

- Enable given channel by CHEN = 1
- Try to clear the clock absence flag (by CLRCKABF = 1) until the clock absence flag is really cleared (CKABF = 0). At this time, the transceiver is synchronized (signal clock is valid) and is able to receive data.
- Enable the clock absence feature CKABEN = 1 and the associated interrupt CKABIE = 1 to detect if the SPI clock is lost or Manchester data edges are missing.

If SPI data format is used, then the clock absence detection is based on the comparison of an external input clock with an output clock generation (CKOUT signal). The external input clock signal into the input channel must be changed at least once per 8 signal periods of CKOUT signal (which is controlled by CKOUTDIV field in DFSDM\_CH0CFGR1 register).

**Figure 166. Clock absence timing diagram for SPI**

If Manchester data format is used, then the clock absence means that the clock recovery is unable to perform from Manchester coded signal. For a correct clock recovery, it is first necessary to receive data with 1 to 0 or 0 to 1 transition (see [Figure 168](#) for Manchester synchronization).

The detection of a clock absence in Manchester coding (after a first successful synchronization) is based on changes comparison of coded serial data input signal with output clock generation (CKOUT signal). There must be a voltage level change on DATINy pin during 2 periods of CKOUT signal (which is controlled by CKOUTDIV bits in DFSDM\_CH0CFGR1 register). This condition also defines the minimum data rate to be able to correctly recover the Manchester coded data and clock signals.

The maximum data rate of Manchester coded data must be less than the CKOUT signal.

So to correctly receive Manchester coded data, the CKOUTDIV divider must be set according the formula:

$$((CKOUTDIV + 1) \times T_{SYSCLK}) < T_{Manchester\ clock} < (2 \times CKOUTDIV \times T_{SYSCLK})$$

A clock absence flag is set (CKABF[y] = 1) and an interrupt can be invoked (if CKABIE=1) in case of an input clock recovery error (see CKABF[7:0] in DFSDM\_FLT0ISR register and CKABEN in DFSDM\_CHyCFGR1). After a clock absence flag clearing (by CLRCKABF in DFSDM\_FLT0ICR register), the clock absence flag is refreshed.

**Figure 167. Clock absence timing diagram for Manchester coding**

### Manchester/SPI code synchronization

The Manchester coded stream must be synchronized the first time after enabling the channel (CHEN=1 in DFSDM\_CHyCFGR1 register). The synchronization ends when a data transition from 0 to 1 or from 1 to 0 (to be able to detect valid data edge) is received. The end of the synchronization can be checked by polling CKABF[y]=0 for a given channel after it has been cleared by CLRCKABF[y] in DFSDM\_FLT0ICR, following the software sequence detailed hereafter:

CKABF[y] flag is cleared by setting CLRCKABF[y] bit. If channel y is not yet synchronized the hardware immediately set the CKABF[y] flag. Software is then reading back the CKABF[y] flag and if it is set then perform again clearing of this flag by setting CLRCKABF[y] bit. This software sequence (polling of CKABF[y] flag) continues until CKABF[y] flag is set (signalizing that Manchester stream is synchronized). To be able to synchronize/receive Manchester coded data the CKOUTDIV divider (in DFSDM\_CH0CFGR1 register) must be set with respect to expected Manchester data rate according the formula below.

$$((CKOUTDIV + 1) \times T_{SYSCLK}) < T_{Manchester\ clock} < (2 \times CKOUTDIV \times T_{SYSCLK})$$

SPI coded stream is synchronized after first detection of clock input signal (valid rising/falling edge).

**Note:** *When the transceiver is not yet synchronized, the clock absence flag is set and cannot be cleared by CLRCKABF[y] bit (in DFSDM\_FLT0ICR register).*

Figure 168. First conversion for Manchester coding (Manchester synchronization)

### External serial clock frequency measurement

The measuring of a channel serial clock input frequency provides a real data rate from an external  $\Sigma\Delta$  modulator, which is important for application purposes.

An external serial clock input frequency can be measured by a timer counting DFSDM clocks ( $f_{DFSDMCLK}$ ) during one conversion duration. The counting starts at the first input data clock after a conversion trigger (regular or injected) and finishes by last input data clock before conversion ends (end of conversion flag is set). Each conversion duration (time between first serial sample and last serial sample) is updated in counter CNVCNT[27:0] in register DFSDM\_FLTxCNVTIMR when the conversion finishes (JEOCF=1 or REOCF=1). The user can then compute the data rate according to the digital filter settings (FORD, FOSR, IOSR, FAST). The external serial frequency measurement is stopped only if the filter is bypassed (FOSR=0, only integrator is active, CNVCNT[27:0]=0 in DFSDM\_FLTxCNVTIMR register).

In case of parallel data input ([Section 24.4.6: Parallel data inputs](#)) the measured frequency is the average input data rate during one conversion.

**Note:** When conversion is interrupted (e.g. by disabling/enabling the selected channel) the interruption time is also counted in CNVCNT[27:0]. Therefore it is recommended to not interrupt the conversion for correct conversion duration result.

Conversion times:

**injected conversion or regular conversion with FAST = 0 (or first conversion if FAST=1):**

for Sinc<sup>x</sup> filters (x=1..5):

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * (I_{\text{OSR}} - 1 + F_{\text{ORD}}) + F_{\text{ORD}}] / f_{\text{CKIN}}$$

for FastSinc filter:

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * (I_{\text{OSR}} - 1 + 4) + 2] / f_{\text{CKIN}}$$

**regular conversion with FAST = 1 (except first conversion):**

for Sinc<sup>x</sup> and FastSinc filters:

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * I_{\text{OSR}}] / f_{\text{CKIN}}$$

**in case if F<sub>OSR</sub> = FOSR[9:0]+1 = 1 (filter bypassed, active only integrator):**

$$t = I_{\text{OSR}} / f_{\text{CKIN}} \text{ (... but CNVCNT=0)}$$

where:

- $f_{\text{CKIN}}$  is the channel input clock frequency (on given channel CKINy pin) or input data rate (in case of parallel data input)
- $F_{\text{OSR}}$  is the filter oversampling ratio:  $F_{\text{OSR}} = \text{FOSR}[9:0] + 1$  (see DFSDM\_FLTxFRCR register)
- $I_{\text{OSR}}$  is the integrator oversampling ratio:  $I_{\text{OSR}} = \text{IOSR}[7:0] + 1$  (see DFSDM\_FLTxFRCR register)
- $F_{\text{ORD}}$  is the filter order:  $F_{\text{ORD}} = \text{FORD}[2:0]$  (see DFSDM\_FLTxFRCR register)

### Channel offset setting

Each channel has its own offset setting (in register) which is finally subtracted from each conversion result (injected or regular) from a given channel. Offset correction is performed after the data right bit shift. The offset is stored as a 24-bit signed value in OFFSET[23:0] field in DFSDM\_CHyCFGR2 register.

### Data right bit shift

To have the result aligned to a 24-bit value, each channel defines a number of right bit shifts which will be applied on each conversion result (injected or regular) from a given channel. The data bit shift number is stored in DTRBS[4:0] bits in DFSDM\_CHyCFGR2 register.

The right bit-shift is rounding the result to nearest integer value. The sign of shifted result is maintained, in order to have valid 24-bit signed format of result data.

## 24.4.5 Configuring the input serial interface

The following parameters must be configured for the input serial interface:

- **Output clock predivider.** There is a programmable predivider to generate the output clock from DFSDM clock (2 - 256). It is defined by CKOUTDIV[7:0] bits in DFSDM\_CH0CFGR1 register.
- **Serial interface type and input clock phase.** Selection of SPI or Manchester coding and sampling edge of input clock. It is defined by SITP [1:0] bits in DFSDM\_CHyCFGR1 register.
- **Input clock source.** External source from CKINy pin or internal from CKOUT pin. It is defined by SPICKSEL[1:0] field in DFSDM\_CHyCFGR1 register.
- **Final data right bit-shift.** Defines the final data right bit shift to have the result aligned to a 24-bit value. It is defined by DTRBS[4:0] in DFSDM\_CHyCFGR2 register.
- **Channel offset per channel.** Defines the analog offset of a given serial channel (offset of connected external  $\Sigma\Delta$  modulator). It is defined by OFFSET[23:0] bits in DFSDM\_CHyCFGR2 register.
- **short-circuit detector and clock absence per channel enable.** To enable or disable the short-circuit detector (by SCDEN bit) and the clock absence monitoring (by CKABEN bit) on a given serial channel in register DFSDM\_CHyCFGR1.
- **Analog watchdog filter and short-circuit detector threshold settings.** To configure channel analog watchdog filter parameters and channel short-circuit detector parameters. Configurations are defined in DFSDM\_CHyAWSCDR register.

## 24.4.6 Parallel data inputs

Each input channel provides a register for 16-bit parallel data input (besides serial data input). Each 16-bit parallel input can be sourced from internal data sources only:

- internal ADC results<sup>(a)</sup>
- direct CPU/DMA writing.

The selection for using serial or parallel data input for a given channel is done by field DATMPX[1:0] of DFSDM\_CHyCFGR1 register. In DATMPX[1:0] is also defined the parallel data source: internal ADC<sup>(a)</sup> or direct write by CPU/DMA.

Each channel contains a 32-bit data input register DFSDM\_CHyDATINR in which it can be written a 16-bit data. Data are in 16-bit signed format. Those data can be used as input to the digital filter which is accepting 16-bit parallel data.

If serial data input is selected (DATMPX[1:0] = 0), the DFSDM\_CHyDATINR register is write protected.

### Input from internal ADC<sup>(a)</sup>

In case of ADC data parallel input (DATMPX[1:0]=1) the ADC[y+1] result is assigned to channel y input (ADC1 is filling DFSDM\_CHDATIN0R register, ADC2 is filling DFSDM\_CHDATIN1R register, ... , ADC8 is filling DFSDM\_CHDATIN7R register). End of conversion event from ADC[y+1] causes update of channel y data (parallel data from ADC[y+1] are put as next sample to digital filter). Data from ADC[y+1] is written into DFSDM\_CHyDATINR register (field INDAT0[15:0]) when end of conversion event occurred.

a. Availability of the input from internal ADC is device dependent, see [Table 155: DFSDM1 implementation](#).

The setting of data packing mode (DATPACK[1:0] in the DFSDM\_CHyCFGR1 register) has no effect in case of ADC data input.

**Note:** *Extension of ADC specification: in case the internal ADC is configured in interleaved mode (e.g. ADC1 together with ADC2 - see ADC specification) then each result from ADC1 or from ADC2 will come to the same 16-bit bus - to the bus of ADC1 - which is coming into DFSDM channel 0 (fixed connection). So there will be double input data rate into DFSDM channel 0 (even samples come from ADC1 and odd samples from ADC2). Channel 1 associated with ADC2 will be free.*

### Input from memory (direct CPU/DMA write)

The direct data write into DFSDM\_CHyDATINR register by CPU or DMA (DATMPX[1:0]=2) can be used as data input in order to process digital data streams from memory or peripherals.

Data can be written by CPU or DMA into DFSDM\_CHyDATINR register:

#### 1. CPU data write:

Input data are written directly by CPU into DFSDM\_CHyDATINR register.

#### 2. DMA data write:

The DMA should be configured in memory-to-memory transfer mode to transfer data from memory buffer into DFSDM\_CHyDATINR register. The destination memory address is the address of DFSDM\_CHyDATINR register. Data are transferred at DMA transfer speed from memory to DFSDM parallel input.

This DMA transfer is different from DMA used to read DFSDM conversion results. Both DMA can be used at the same time - first DMA (configured as memory-to-memory transfer) for input data writings and second DMA (configured as peripheral-to-memory transfer) for data results reading.

The accesses to DFSDM\_CHyDATINR can be either 16-bit or 32-bit wide, allowing to load respectively one or two samples in one write operation. 32-bit input data register (DFSDM\_CHyDATINR) can be filled with one or two 16-bit data samples, depending on the data packing operation mode defined in field DATPACK[1:0] of DFSDM\_CHyCFGR1 register:

#### 1. Standard mode (DATPACK[1:0]=0):

Only one sample is stored in field INDAT0[15:0] of DFSDM\_CHyDATINR register which is used as input data for channel y. The upper 16 bits (INDAT1[15:0]) are ignored and write protected. The digital filter must perform one input sampling (from INDAT0[15:0]) to empty data register after it has been filled by CPU/DMA. This mode is used together with 16-bit CPU/DMA access to DFSDM\_CHyDATINR register to load one sample per write operation.

#### 2. Interleaved mode (DATPACK[1:0]=1):

DFSDM\_CHyDATINR register is used as a two sample buffer. The first sample is stored in INDAT0[15:0] and the second sample is stored in INDAT1[15:0]. The digital filter must perform two input samplings from channel y to empty DFSDM\_CHyDATINR register. This mode is used together with 32-bit CPU/DMA access to DFSDM\_CHyDATINR register to load two samples per write operation.

#### 3. Dual mode (DATPACK[1:0]=2):

Two samples are written into DFSDM\_CHyDATINR register. The data INDAT0[15:0] is for channel y, the data in INDAT1[15:0] is for channel y+1. The data in INDAT1[15:0] is automatically copied INDAT0[15:0] of the following (y+1) channel data register

DFSDM\_CH[y+1]DATINR). The digital filters must perform two samplings - one from channel y and one from channel (y+1) - in order to empty DFSDM\_CHyDATINR registers.

Dual mode setting (DATPACK[1:0]=2) is available only on even channel numbers (y = 0, 2, 4, 6). If odd channel (y = 1, 3, 5, 7) is set to Dual mode then both INDAT0[15:0] and INDAT1[15:0] parts are write protected for this channel. If even channel is set to Dual mode then the following odd channel must be set into Standard mode (DATPACK[1:0]=0) for correct cooperation with even channels.

See [Figure 169](#) for DFSDM\_CHyDATINR registers data modes and assignments of data samples to channels.

**Figure 169. DFSDM\_CHyDATINR registers operation modes and assignment**

| Standard mode |                | Interleaved mode |                | Dual mode      |                |              |
|---------------|----------------|------------------|----------------|----------------|----------------|--------------|
| 31            | 16 15 0        | 31               | 16 15 0        | 31             | 16 15 0        |              |
| Unused        | Ch0 (sample 0) | Ch0 (sample 1)   | Ch0 (sample 0) | Ch1 (sample 0) | Ch0 (sample 0) | <b>y = 0</b> |
| Unused        | Ch1 (sample 0) | Ch1 (sample 1)   | Ch1 (sample 0) | Unused         | Ch1 (sample 0) | <b>y = 1</b> |
| Unused        | Ch2 (sample 0) | Ch2 (sample 1)   | Ch2 (sample 0) | Ch3 (sample 0) | Ch2 (sample 0) | <b>y = 2</b> |
| Unused        | Ch3 (sample 0) | Ch3 (sample 1)   | Ch3 (sample 0) | Unused         | Ch3 (sample 0) | <b>y = 3</b> |
| Unused        | Ch4 (sample 0) | Ch4 (sample 1)   | Ch4 (sample 0) | Ch5 (sample 0) | Ch4 (sample 0) | <b>y = 4</b> |
| Unused        | Ch5 (sample 0) | Ch5 (sample 1)   | Ch5 (sample 0) | Unused         | Ch5 (sample 0) | <b>y = 5</b> |
| Unused        | Ch6 (sample 0) | Ch6 (sample 1)   | Ch6 (sample 0) | Ch7 (sample 0) | Ch6 (sample 0) | <b>y = 6</b> |
| Unused        | Ch7 (sample 0) | Ch7 (sample 1)   | Ch7 (sample 0) | Unused         | Ch7 (sample 0) | <b>y = 7</b> |

MS35354V3

The write into DFSDM\_CHyDATINR register to load one or two samples must be performed after the selected input channel (channel y) is enabled for data collection (starting conversion for channel y). Otherwise written data are lost for next processing.

For example: for single conversion and interleaved mode, do not start writing pair of data samples into DFSDM\_CHyDATINR before the single conversion is started (any data present in the DFSDM\_CHyDATINR before starting a conversion is discarded).

#### 24.4.7 Channel selection

There are 8 multiplexed channels which can be selected for conversion using the injected channel group and/or using the regular channel.

The **injected channel group** is a selection of any or all of the 8 channels. JCHG[7:0] in the DFSDM\_FLTxJCHGR register selects the channels of the injected group, where JCHG[y]=1 means that channel y is selected.

Injected conversions can operate in scan mode (JSCAN=1) or single mode (JSCAN=0). In scan mode, each of the selected channels is converted, one after another. The lowest channel (channel 0, if selected) is converted first, followed immediately by the next higher channel until all the channels selected by JCHG[7:0] have been converted. In single mode (JSCAN=0), only one channel from the selected channels is converted, and the channel selection is moved to the next channel. Writing to JCHG[7:0] if JSCAN=0 resets the channel selection to the lowest selected channel.

Injected conversions can be launched by software or by a trigger. They are never interrupted by regular conversions.

The **regular channel** is a selection of just one of the 8 channels. RCH[2:0] in the DFSDM\_FLTxCR1 register indicates the selected channel.

Regular conversions can be launched only by software (not by a trigger). A sequence of continuous regular conversions is temporarily interrupted when an injected conversion is requested.

Performing a conversion on a disabled channel (CHEN=0 in DFSDM\_CHyCFGR1 register) causes that the conversion will never end - because no input data is provided (with no clock signal). In this case, it is necessary to enable a given channel (CHEN=1 in DFSDM\_CHyCFGR1 register) or to stop the conversion by DFEN=0 in DFSDM\_FLTxCR1 register.

#### 24.4.8 Digital filter configuration

DFSDM contains a Sinc<sup>x</sup> type digital filter implementation. This Sinc<sup>x</sup> filter performs an input digital data stream filtering, which results in decreasing the output data rate (decimation) and increasing the output data resolution. The Sinc<sup>x</sup> digital filter is configurable in order to reach the required output data rates and required output data resolution. The configurable parameters are:

- Filter order/type: (see FORD[2:0] bits in DFSDM\_FLTxFCR register):
  - FastSinc
  - Sinc<sup>1</sup>
  - Sinc<sup>2</sup>
  - Sinc<sup>3</sup>
  - Sinc<sup>4</sup>
  - Sinc<sup>5</sup>
- Filter oversampling/decimation ratio (see FOSR[9:0] bits in DFSDM\_FLTxFCR register):
  - FOSR = 1-1024 - for FastSinc filter and Sinc<sup>x</sup> filter x = F<sub>ORD</sub> = 1..3
  - FOSR = 1-215 - for Sinc<sup>x</sup> filter x = F<sub>ORD</sub> = 4
  - FOSR = 1-73 - for Sinc<sup>x</sup> filter x = F<sub>ORD</sub> = 5

The filter has the following transfer function (impulse response in H domain):

- Sinc<sup>x</sup> filter type: 
$$H(z) = \left( \frac{1 - z^{-FOSR}}{1 - z^{-1}} \right)^x$$
- FastSinc filter type: 
$$H(z) = \left( \frac{1 - z^{-FOSR}}{1 - z^{-1}} \right)^2 \cdot (1 + z^{-(2 \cdot FOSR)})$$

Figure 170. Example: Sinc<sup>3</sup> filter response

Table 160. Filter maximum output resolution (peak data values from filter output) for some FOSR values

| FOSR | Sinc <sup>1</sup> | Sinc <sup>2</sup>  | FastSinc            | Sinc <sup>3</sup>  | Sinc <sup>4</sup>                                                 | Sinc <sup>5</sup>                                                 |  |
|------|-------------------|--------------------|---------------------|--------------------|-------------------------------------------------------------------|-------------------------------------------------------------------|--|
| x    | +/- x             | +/- x <sup>2</sup> | +/- 2x <sup>2</sup> | +/- x <sup>3</sup> | +/- x <sup>4</sup>                                                | +/- x <sup>5</sup>                                                |  |
| 4    | +/- 4             | +/- 16             | +/- 32              | +/- 64             | +/- 256                                                           | +/- 1024                                                          |  |
| 8    | +/- 8             | +/- 64             | +/- 128             | +/- 512            | +/- 4096                                                          | -                                                                 |  |

For more information about Sinc filter type properties and usage, it is recommended to study the theory about digital filters (more resources can be downloaded from internet).

#### 24.4.9 Integrator unit

The integrator performs additional decimation and a resolution increase of data coming from the digital filter. The integrator simply performs the sum of data from a digital filter for a given number of data samples from a filter.

The integrator oversampling ratio parameter defines how many data counts will be summed to one data output from the integrator. IOSR can be set in the range 1-256 (see IOSR[7:0] bits description in DFSDM\_FLTxFQR register).

**Table 161. Integrator maximum output resolution (peak data values from integrator output) for some IOSR values and FOSR = 256 and Sinc<sup>3</sup> filter type (largest data)**

| IOSR | Sinc <sup>1</sup> | Sinc <sup>2</sup>         | FastSinc                    | Sinc <sup>3</sup>         | Sinc <sup>4</sup>         | Sinc <sup>5</sup>         |

#### 24.4.10 Analog watchdog

The analog watchdog purpose is to trigger an external signal (break or interrupt) when an analog signal reaches or crosses given maximum and minimum threshold values. An interrupt/event/break generation can then be invoked.

Each analog watchdog will supervise serial data receiver outputs (after the analog watchdog filter on each channel) or data output register (current injected or regular conversion result) according to AWFSEL bit setting (in DFSDM\_FLTxCr1 register). The input channels to be monitored or not by the analog watchdog x will be selected by AWDCH[7:0] in DFSDM\_FLTxCr2 register.

Analog watchdog conversions on input channels are independent from standard conversions. In this case, the analog watchdog uses its own filters and signal processing on each input channel independently from the main injected or regular conversions. Analog watchdog conversions are performed in a continuous mode on the selected input channels in order to watch channels also when main injected or regular conversions are paused (RCIP = 0, JCIP = 0).

There are high and low threshold registers which are compared with given data values (set by AWHT[23:0] bits in DFSDM\_FLTxAWHTR register and by AWLT[23:0] bits in DFSDM\_FLTxAWLTR register).

There are 2 options for comparing the threshold registers with the data values

- Option1: in this case, the input data are taken from final output data register (AWFSEL=0). This option is characterized by:
  - high input data resolution (up to 24-bits)
  - slow response time - inappropriate for fast response applications like overcurrent detection
  - for the comparison the final data are taken after bit shifting and offset data correction
  - final data are available only after main regular or injected conversions are performed
  - can be used in case of parallel input data source (DATMPX[1:0] ≠ 0 in DFSDM\_CHyCFGR1 register)
- Option2: in this case, the input data are taken from any serial data receivers output (AWFSEL=1). This option is characterized by:
  - input serial data are processed by dedicated analog watchdog Sinc<sup>x</sup> channel filters with configurable oversampling ratio (1..32) and filter order (1..3) (see AWFOSR[4:0] and AWFORD[1:0] bits setting in DFSDM\_CHyAWSCDR register)
  - lower resolution (up to 16-bit)
  - fast response time - appropriate for applications which require a fast response like overcurrent/overvoltage detection)
  - data are available in continuous mode independently from main regular or injected conversions activity

In case of input channels monitoring (AWFSEL=1), the data for comparison to threshold is taken from channels selected by AWDCH[7:0] field (DFSDM\_FLTxCR2 register). Each of the selected channels filter result is compared to one threshold value pair (AWHT[23:0] / AWLT[23:0]). In this case, only higher 16 bits (AWHT[23:8] / AWLT[23:8]) define the 16-bit threshold compared with the analog watchdog filter output because data coming from the analog watchdog filter is up to a 16-bit resolution. Bits AWHT[7:0] / AWLT[7:0] are not taken into comparison in this case (AWFSEL=1).

Parameters of the analog watchdog filter configuration for each input channel are set in DFSDM\_CHyAWSCDR register (filter order AWFORD[1:0] and filter oversampling ratio AWFOSR[4:0]).

Each input channel has its own comparator which compares the analog watchdog data (from analog watchdog filter) with analog watchdog threshold values (AWHT/AWLT). When several channels are selected (field AWDCH[7:0] field of DFSDM\_FLTxCR2 register), several comparison requests may be received simultaneously. In this case, the channel request with the lowest number is managed first and then continuing to higher selected channels. For each channel, the result can be recorded in a separate flag (fields AWHTF[7:0], AWLTF[7:0] of DFSDM\_FLTxAWSR register). Each channel request is executed in 8 DFSDM clock cycles. So, the bandwidth from each channel is limited to 8 DFSDM clock cycles (if AWDCH[7:0] = 0xFF). Because the maximum input channel sampling clock frequency is the DFSDM clock frequency divided by 4, the configuration AWFOSR = 0 (analog watchdog filter is bypassed) cannot be used for analog watchdog feature at this input clock speed. Therefore user must properly configure the number of watched channels and analog watchdog filter parameters with respect to input sampling clock speed and DFSDM frequency.

Analog watchdog filter data for given channel y is available for reading by firmware on field WDATA[15:0] in DFSDM\_CHyWDATR register. That analog watchdog filter data is converted continuously (if CHEN=1 in DFSDM\_CHyCFGR1 register) with the data rate given by the analog watchdog filter setting and the channel input clock frequency.

The analog watchdog filter conversion works like a regular Fast Continuous Conversion without the intergator. The number of serial samples needed for one result from analog watchdog filter output (at channel input clock frequency  $f_{CKIN}$ ):

first conversion:

for Sinc<sup>x</sup> filters (x=1..5): number of samples =  $[F_{OSR} * F_{ORD} + F_{ORD} + 1]$

for FastSinc filter: number of samples =  $[F_{OSR} * 4 + 2 + 1]$

next conversions:

for Sinc<sup>x</sup> and FastSinc filters: number of samples =  $[F_{OSR} * IOSR]$

where:

$F_{OSR}$  ..... filter oversampling ratio:  $F_{OSR} = AWFOSR[4:0] + 1$  (see DFSDM\_CHyAWSCDR register)

$F_{ORD}$  ..... the filter order:  $F_{ORD} = AWFORD[1:0]$  (see DFSDM\_CHyAWSCDR register)

In case of output data register monitoring (AWFSEL=0), the comparison is done after a right bit shift and an offset correction of final data (see OFFSET[23:0] and DTRBS[4:0] fields in DFSDM\_CHyCFGR2 register). A comparison is performed after each injected or regular end of conversion for the channels selected by AWDCH[7:0] field (in DFSDM\_FLTxCR2 register).

The status of an analog watchdog event is signalized in DFSDM\_FLTxAWSR register where a given event is latched. AWHTF[y]=1 flag signalizes crossing AWHT[23:0] value on channel y. AWLTF[y]=1 flag signalizes crossing AWLT[23:0] value on channel y. Latched events in DFSDM\_FLTxAWSR register are cleared by writing '1' into the corresponding clearing bit CLRAWHTF[y] or CLRAWLTF[y] in DFSDM\_FLTxAWCFR register.

The global status of an analog watchdog is signalized by the AWDF flag bit in DFSDM\_FLTxISR register (it is used for the fast detection of an interrupt source). AWDF=1 signalizes that at least one watchdog occurred (AWHTF[y]=1 or AWLTF[y]=1 for at least one channel). AWDF bit is cleared when all AWHTF[7:0] and AWLTF[7:0] are cleared.

An analog watchdog event can be assigned to break output signal. There are four break outputs to be assigned to a high or low threshold crossing event (dfsdm\_break[3:0]). The break signal assignment to a given analog watchdog event is done by BKAWH[3:0] and BKAWL[3:0] fields in DFSDM\_FLTxAWHTR and DFSDM\_FLTxAWLTR register.

#### 24.4.11 Short-circuit detector

The purpose of a short-circuit detector is to signalize with a very fast response time if an analog signal reached saturated values (out of full scale ranges) and remained on this value given time. This behavior can detect short-circuit or open circuit errors (e.g. overcurrent or overvoltage). An interrupt/event/break generation can be invoked.

Input data into a short-circuit detector is taken from channel transceiver outputs.

There is an upcounting counter on each input channel which is counting consecutive 0's or 1's on serial data receiver outputs. A counter is restarted if there is a change in the data stream received - 1 to 0 or 0 to 1 change of data signal. If this counter reaches a short-circuit threshold register value (SCDT[7:0] bits in DFSDM\_CHyAWSCDR register), then a short-

circuit event is invoked. Each input channel has its short-circuit detector. Any channel can be selected to be continuously monitored by setting the SCDEN bit (in DFSDM\_CHyCFGR1 register) and it has its own short-circuit detector settings (threshold value in SCDT[7:0] bits, status bit SCDF[7:0], status clearing bits CLRSCDF[7:0]). Status flag SCDF[y] is cleared also by hardware when corresponding channel y is disabled (CHEN[y] = 0).

On each channel, a short-circuit detector event can be assigned to break output signal dfsdm\_break[3:0]. There are four break outputs to be assigned to a short-circuit detector event. The break signal assignment to a given channel short-circuit detector event is done by BKSCD[3:0] field in DFSDM\_CHyAWSCDR register.

Short circuit detector cannot be used in case of parallel input data channel selection (DATMPX[1:0] ≠ 0 in DFSDM\_CHyCFGR1 register).

Four break outputs are totally available (shared with the analog watchdog function).

#### 24.4.12 Extreme detector

The purpose of an extremes detector is to collect the minimum and maximum values of final output data words (peak to peak values).

If the output data word is higher than the value stored in the extremes detector maximum register (EXMAX[23:0] bits in DFSDM\_FLTxEXMAX register), then this register is updated with the current output data word value and the channel from which the data is stored is in EXMAXCH[2:0] bits (in DFSDM\_FLTxEXMAX register) .

If the output data word is lower than the value stored in the extremes detector minimum register (EXMIN[23:0] bits in DFSDM\_FLTxEXMIN register), then this register is updated with the current output data word value and the channel from which the data is stored is in EXMINCH[2:0] bits (in DFSDM\_FLTxEXMIN register).

The minimum and maximum register values can be refreshed by software (by reading given DFSDM\_FLTxEXMAX or DFSDM\_FLTxEXMIN register). After refresh, the extremes detector minimum data register DFSDM\_FLTxEXMIN is filled with 0x7FFFFFFF (maximum positive value) and the extremes detector maximum register DFSDM\_FLTxEXMAX is filled with 0x800000 (minimum negative value).

The extremes detector performs a comparison after a right bit shift and an offset data correction. For each extremes detector, the input channels to be considered into computing the extremes value are selected in EXCH[7:0] bits (in DFSDM\_FLTxCR2 register).

#### 24.4.13 Data unit block

The data unit block is the last block of the whole processing path: External ΣΔ modulators - Serial transceivers - Sinc filter - Integrator - Data unit block.

The output data rate depends on the serial data stream rate, and filter and integrator settings. The maximum output data rate is:

$$\text{Datarate}[\text{samples} / \text{s}] = \frac{f_{\text{CKIN}}}{F_{\text{OSR}} \cdot (I_{\text{OSR}} - 1 + F_{\text{ORD}}) + (F_{\text{ORD}} + 1)} \quad \dots \text{FAST} = 0, \text{Sincx filter}$$

$$\text{Datarate}[\text{samples} / \text{s}] = \frac{f_{\text{CKIN}}}{F_{\text{OSR}} \cdot (I_{\text{OSR}} - 1 + 4) + (2 + 1)} \quad \dots \text{FAST} = 0, \text{FastSinc filter}$$

or

$$\text{Datarate}[\text{samples} / \text{s}] = \frac{f_{\text{CKIN}}}{F_{\text{OSR}} \cdot I_{\text{OSR}}} \quad \dots \text{FAST} = 1$$

Maximum output data rate in case of parallel data input:

$$\text{Datarate}[\text{samples} / \text{s}] = \frac{f_{\text{DATAIN\_RATE}}}{F_{\text{OSR}} \cdot (I_{\text{OSR}} - 1 + F_{\text{ORD}}) + (F_{\text{ORD}} + 1)} \quad \dots \text{FAST} = 0, \text{Sincx filter}$$

or
